3  Module Descriptions .................................................................................................................................................. 20
1 Introduction and General Information

This document lists all modules offered in the Faculty of Information Systems and Applied Computer Sciences during the academic year 2023-2024.

To prevent problems arising from late changes on these offerings, you are advised to confirm module specifications and schedules through the research groups’ web pages or directly with the responsible teaching staff. There may also be new courses becoming available on short notice. Please see the faculty's web pages for relevant announcements. The official German module handbooks for the various degree courses can be accessed through the following links:

- B.Sc. Angewandte Informatik
- B.Sc. International Information Systems Management
- B.Sc. Informatik: Software Systems Sciences
- B.Sc. Information Systems (Wirtschaftsinformatik)
- M.Sc. Applied Computer Sciences
- M.Sc. Computing in the Humanities
- M.Sc. International Software Systems Science
- M.Sc. Information Systems (Wirtschaftsinformatik)
- M.Sc. International Information Systems Management

1.1 Fees and Registration

All modules are currently open free of charge to foreign guest students who will study at Bamberg University within the frame of a partnership exchange programme, such as ERASMUS+. There are no tuition or bench fees. Enrolment with the University incurs a nominal registration fee covering administration charges, student union membership (Studentenwerk) and the City of Bamberg travel ticket.

Information on the registration and enrolment process may be obtained from the International Office who will also be able to advise you on any exchange scheme that may exist between Bamberg University and your home institution.

Once admitted to and enrolled with Bamberg University you do not need to register for attending a teaching module. Feel free to sit in and participate in any course offering that fits your educational needs and time table. Be aware, though, that some courses may have entry requirements and/or class size restrictions.
1.2 Teaching Times

The academic year 2023-2024 consists of two teaching periods. Winter semester at Germany Universities always starts on 1st October and ends on 31st March. Summer semester always starts on 1st April and ends on 30th September. Lectures usually start two weeks later:

Winter Semester lecture start: 16th October 2023 – 09th February 2024,
Summer Semester lecture start: 15th April 2024 – 19th July 2024.

1.3 Assessment

The course assessment is done mostly by written exams and optionally also by way of homework assignments and/or lab practicals. In a number of cases, typically for graduate level modules, the final exam is oral. Final written exams are usually held immediately after the end of the lecture period, i.e. February/March for the Winter Semester and end of July/August for the Summer Semester. Make sure you plan your travelling so you are in Bamberg during the exams.

Be aware that there are firm deadlines for exam registration some time at the end of the first half of the semester. Watch out for the emails announcing the registration period and check up with your class mates if you are not sure. There is a short period of time during which you can deregister from an exam. Once this period has passed and you are registered you must take the exam at the specified day and time. Also, if you miss the online registration deadline, then you cannot participate in the exam.

There is one more thing to know: For written exams the registration in FlexNow2 is sufficient. For oral exams, however, you also need to arrange an exam time with the lecturer in addition to the FlexNow2 registration.

If for some reason you cannot attend the regular written exam, say because you are required to return home early, talk to the course lecturer before the FlexNow2 registration period has passed. There are two options:

Option 1: The course lecturer may be able to arrange an oral exam for you at an earlier date instead.
In this case, because you are not writing the official exam, you must not register with the FlexNow2 system.

Option 2: It is sometimes possible that we schedule the regular exam at your Home University on the same day and at the same time when it is written in Bamberg. For this option you must register via FlexNow2! Please contact the Career & International Center early to obtain advice on how to arrange remote exams.

Whether such options are available is entirely at the discretion of the course lecturer.

The official exam language is German, but many courses may offer written or oral exams in English if required. Some modules are fully taught in English, some only at the discretion of the lecturer. If you need to be set an
English exam for a module delivered in German you should contact the module lecturer early to find out if this is possible. The description of each module listed below in this booklet indicates if all or some part of the module is delivered in English.

### 1.4 Workload

The module descriptions below specify the total module workload in terms of ECTS (European Credit Transfer System) credit points according to the following approximate accounting scheme:

- 1 ECTS = 25-30 hrs total student workload (all inclusive)
- 30 ECTS = total module load per semester
- 6 ECTS = single standard course module of 4 contact hrs/week, combining lectures+tutorials

### 1.5 Course Levels and Teaching Format

In line with our traditional Diploma degree structure, modules are taught at 2 levels:

- **Basic Studies**
  These are foundational and introductory courses in the general disciplines of Information Systems, Applied Computer Science and Software Systems Science corresponding to the 1\(^{st}\) and 2\(^{nd}\) year of the undergraduate B.Sc. programmes.

- **Advanced Studies**
  These are introductory courses to specialized fields within Information Systems, Applied Computer Science and Software Systems Science corresponding to the 3\(^{rd}\) year of the B.Sc. degree and advanced modules in particular research areas which correspond to the 1\(^{st}\) and 2\(^{nd}\) year of the graduate M.Sc. programmes.

As our guest students you may attend modules at any of these levels. It is your responsibility to judge if your background will be sufficient to participate successfully in the course. Also, whether or not the credits you earn are valid towards your home degree, is not decided by us, but by your home institution.

Keep in mind, however, that graduate level modules normally assume a significant amount of background in the relevant subject area.

Most modules are based on combined lectures and tutorials. Some courses may also involve lab classes, excursions, blended learning and other teaching arrangements. Research groups regularly offer advanced level seminars and project modules on varying research topics. These may have special entry prerequisites.
1.6 Other Information

The International Office provides information on accommodation, living expenses, language courses and many other aspects of student life at Bamberg.

**International Office**

Mrs. Julia Argikola  
Secretary - Foreign Student Affairs  
Otto-Friedrich-Universität Bamberg  
D-96047 Bamberg, Germany  
Kapuzinerstraße 25  
Tel: ++49 (0)951-863-1049  
Fax: ++49 (0)951 863-1054  
Email: international@uni-bamberg.de  
URL: [https://www.uni-bamberg.de/international-office/](https://www.uni-bamberg.de/international-office/)

You are also welcome to contact the International Affairs Representative of the WIAI Faculty (see address page 2).

The Faculty of Social Sciences, Economics and Business Administration’s UNICOACH can be found here:  

UNICOACH is a series of short videos providing information on important student life issues like “how to understand the university system” or „how to register for classes and exams“.
2 Introducing the Faculty's Teaching and Research Groups

2.1 Applied Computer Science

KogSys – Cognitive Systems
Prof. Dr. Ute Schmid
Head of Cognitive Systems Group
Office 05.043
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-2860
Mail: ute.schmid@uni-bamberg.de
Internet: http://www.uni-bamberg.de/kogsys

In the research domain Cognitive Systems (CogSys) we are concerned with the development of approaches, concepts, and methods for design, description, construction and analysis of intelligent systems based on cognitive principles. Our research strategy is to combine empirical studies of cognitive phenomena, development of algorithms, and their testing in different areas of application. Main topics of our group are induction and learning as well as planning and problem solving in single- and multi-agent settings. Especially, we are interested in the inductive synthesis of recursive functional programs from incomplete specifications (e.g., input/output examples) which can be seen as a general approach to learning productive rules from experience. Furthermore, we investigate analogical reasoning as a powerful approach to problem solving as a special mechanism of knowledge acquisition. Application areas are, for example, support of human problem solvers in the domains of software development, classifier learning for medical diagnostics, quality control, decision support or incident mining and assistant systems for activities of daily life.

KInf – Computing in the Cultural Sciences
Prof. Dr. Christoph Schlieder
Chair of Computing in the Cultural Sciences
Office 02.033
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-2840
Mail: christoph.schlieder@uni-bamberg.de
Internet: http://www.uni-bamberg.de/kinf/

In research and teaching, we focus on computational issues relevant to the cultural sciences. At our laboratory we develop software solutions that assist, for instance, preservation scientists working with built heritage or sociologists studying web-based communication processes. Technologically speaking, our software relies on methods from semantic information processing that we continue to improve. Our key areas of interest are
Geoinformation systems and services, Digital libraries and archives, Mobile assistance systems, and Computer-mediated communication.

**MI – Media Informatics**
Prof. Dr. Andreas Henrich
Chair of Media Informatics
Office 02.031
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-2850
Mail: andreas.henrich@uni-bamberg.de
Internet: http://www.uni-bamberg.de/minf/

Media Informatics aims at a purposeful application of single media types and multimedia systems in various application areas. It considers aspects like media technique, media design, media storage and retrieval as well as the use of media with a focus on the development of multimedia systems. The main focus of this chair is on media storage and retrieval and the development of domain specific multimedia applications.

**HCI – Human-Computer Interaction**
Prof. Dr. Tom Gross
Chair of Human-Computer Interaction
Office 01.032
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-3940
Mail: tom.gross@uni-bamberg.de
Internet: http://www.uni-bamberg.de/hci

Human-Computer Interaction (HCI) aims at optimally supporting users through technology (mainly computer technology) by amplifying their strengths and compensating their weaknesses. The Special Interest Group HCI of the German Informatics Society provides the following definition: “The field of Human-Computer Interaction comprises the analysis, design, and evaluation of human- and task-centred computer applications” (in German).

In the context of HCI interactive systems are often mentioned—an interactive (computer-) system thereby is described as a unity consisting of software and hardware that receives input from users and gives immediate feedback. The usability of interactive systems can be evaluated along three factors: effectiveness (accuracy and completeness with which users achieve their goals), efficiency (resources expended by users to achieve these goals), and satisfaction (the users’ positive attitudes towards the use of the system).
SME – Smart Environments
Prof. Dr. Diedrich Wolter
Chair of Smart Environments
Office 03.040
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-2897
Mail: diedrich.wolter@uni-bamberg.de
Internet: https://www.uni-bamberg.de/en/sme/

Smart environments is a young area of research in applied artificial intelligence (AI). The field draws its motivations from recent advancements in AI as well as in technology (disappearing computers, sensors) and human-centered computing. At the University of Bamberg, we contribute by tackling the following research questions:
- How can sensor data be interpreted to obtain useful knowledge?
- How can knowledge about space, time, events, and context be represented?
- And how can we reason with this knowledge in order to obtain smart decisions?

VIS – Information Visualization
Prof. Dr. Fabian Beck
Chair of Information Visualization
Office 05.099
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-3040
Mail: fabian.beck@uni-bamberg.de
Internet: https://www.uni-bamberg.de/en/vis/

We envision to help people understand data. We design and implement novel visualizations that support users in effectively analyzing complex data and gain new insights.
AISE – AI Systems Engineering

Prof. Dr. Fabian Beck
Chair of Information Visualization
Office 05.090
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-2942
Mail: christoph.benzmueller@uni-bamberg.de
Internet: https://www.uni-bamberg.de/aise/

Our research activities are interfacing the areas of artificial intelligence, philosophy, mathematics, computer science, and natural language. Current research focuses on the use of formal argumentation & explanation to achieve trustworthy AI systems, that is reasonable machines. I am particularly interested in the use of classical higher-order logic (HOL) as a universal meta-logic to automate various non-classical logics and to utilise them in topical application areas, including machine ethics & machine law, metaphysics (e.g. Gödel’s ontological argument), mathematical foundations (e.g. category theory) and rational argumentation. My research activities also address the integration of automated reasoning, machine learning and agent-based architectures. I have a core expertise in classical higher-order logic (HOL), and I have contributed to its semantics and proof theory, and together with colleagues and students I have developed the Leo theorem provers for HOL.

xAI – Explainable Machine Learning

Prof. Dr. Christian Ledig
Chair of Explainable Machine Learning
Office 04.083
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-2025
Mail: christian.ledig@uni-bamberg.de
Internet: https://www.uni-bamberg.de/xai/

The research group focuses on the development of robust, data-efficient methods of machine learning with varied applications in the industry and especially in the healthcare sector. The overarching goal is to make a positive contribution to the society, or human wellbeing respectively. You can find a detailed description of our research areas on our website in the section “research focus”. Our teaching activities include courses on Deep Learning and Mathematics for Machine Learning for Master students as well as several Seminars and Projects for Bachelor and Master students. We teach in English and our exams and course material are also in English.
DS – Natural Language Generation and Dialogue Systems
Prof. Dr. Stefan Ultes
Chair of Natural Language Generation and Dialogue Systems
Office 02.27
Gutenbergstraße 13
96047 Bamberg
Tel.: 0951/863-2900
Mail: stefan.ultes@uni-bamberg.de
Web: https://www.uni-bamberg.de/ds/

We are currently in the process of building the group and additional content will follow shortly.

CG – Computer Graphics
Prof. Dr. Sophie Jörg
Chair of Computer Graphics and its Foundations
Office GU13/01.26
Gutenbergstraße 13
96052 Bamberg
Mail: sophie.joerg@uni-bamberg.de

The Chair will start teaching in Winter Semester 2024.

UxD – User Experience and Design
Prof. Dr. Patrick Tobias Fischer
Chair of User Experience and Design
Office WE5N/02.02
An der Weberei 5
96047 Bamberg
Mail: patrick-tobias.fischer@uni-bamberg.de
Internet: https://www.uni-bamberg.de/uxd/

At the chair of User Experience and Design our teaching activities center on Urban Interaction Design, Interface Design and Multimodal Experiences. We develop knowledge for and through design. By prototyping novel types of interaction and interfaces we explore experiential and sociopragmatic values, relationships, materiality and behaviour in the context of public life and urban environments. To unlock the students and our creative potential and imagine novel interactive situations, we constantly learn about and engage with a variety of design materials. Sensors, actuators, micropocessors, blue foam, paper, 3D prints, 2- and 3D-graphics, artificial intelllicence, behavioural patterns, etc. are just a few to name. Combined with theoretic knowledge from Urban Design, MediaArchitecture and HCI novel ways of user experiences are shaped to discover new knowledge.
## 2.2 Computer Science

**DSG – Practical Computer Science (Distributed Systems)**

Prof. Dr. Guido Wirtz  
Chair of Practical Computer Science  
Distributed Systems Group  
Office 03.016  
An der Weberei 5  
96047 Bamberg  
Tel.: 0951/863-2527  
Mail: guido.wirtz@uni-bamberg.de  
Internet: http://www.uni-bamberg.de/en/pi

Besides introductory courses for 1st and 2nd year students, our teaching activities put an emphasis on combining the theoretical background of distributed systems with knowledge about middleware and architecture for complex systems. This is done by advanced courses and seminars as well as practical labs to get hands-on experience with real-life systems. All courses require hands-on programming using recent technologies like, e.g., gRPC, REST, Microservices, ...

The DSG's research directions are centered on issues regarding the software development for complex, esp. distributed, systems on all levels. Our current research activities are focussed on the seamless transition from business processes to their implementation in a SOA and cloud context, Microservice architectures, as well as new approaches for the Internet-of-Things (IoT) like Edge- and Fog-Computing as well as in modern cloud techniques like, e.g. Serverless computing.

**GdI – Foundations of Computer Science**

Prof. Michael Mendler, PhD (Edinburgh)  
Informatics Theory Group  
Office 03.26  
Gutenbergstraße 13  
96050 Bamberg  
Tel.: 0951/863-2828  
Mail: michael.mendler@uni-bamberg.de  
Internet: http://www.gdi.uni-bamberg.de

The group teaches the foundational aspects of computer science in all degree programmes, such as logic, automata and formal language theory, functional programming and the theory of distributed systems. In our research we are mainly concerned with constructive modal logic and type theory and their applications as well as the semantics of synchronous programming languages.
KTR – Communication Systems and Computer Networks

Prof. Dr. Udo R. Krieger
Head of Computer Networks Group
Office 05.037
An der Weberei 5
96047 Bamberg

Tel.: 0951/863-2820
Mail: udo.krieger@uni-bamberg.de
Internet: http://www.uni-bamberg.de/ktr

Research and development of the group is devoted to traffic and network management of current telecommunication networks and future IP based fixed and mobile computer networks. Current research topics include the evaluation of resource management processes in wireless local IP networks, the development of QoS management architectures for IP communication networks, teletraffic theory and performance evaluation of such distributed systems, the statistical analysis and characterization of Internet traffic, and the estimation of corresponding generic model parameters.

MOBI – Chair of Mobile Systems

Prof. Dr. Daniela Nicklas
Chair of Information Systems, esp. Mobile Software Systems / Mobility
Office 05.128
An der Weberei 5
96047 Bamberg

Tel.: 0951/863-3670
Mail: daniela.nicklas@uni-bamberg.de
Internet: https://www.uni-bamberg.de/en/mobi/

The MOBI group is led by Prof. Dr. Daniela Nicklas and focuses on data management for mobile systems, data stream management/complex event processing and development support for sensor-based applications, in the area of smart cities.
The Software Technologies Research Group (SWT) specializes in the quality assurance of complex software systems based on model-centric engineering and formal analysis. Specific areas of expertise are software testing, automated verification, program comprehension, concurrency theory, synchronous real-time systems, and intelligent cyber-physical systems. Students enrolling in SWT modules are expected to have a strong interest in software engineering and modelling, be proficient in mathematical and computational thinking, and show a high degree of commitment to learning.

PSI – Privacy and Security in Information Systems Group

The focus of the PSI Group is the protection of information systems and the protection of privacy with technical mechanisms. To this end, the PSI Group analyzes and evaluates existing systems and develops protective mechanisms. The PSI Group cooperates with working groups in the fields of machine learning (inference attacks, online tracking), law (data protection, law enforcement) and ethics (value-oriented system design).
SYSNAP – Systems Programming
Prof. Dr. Michael Engel
Practical Computer Science, esp. Systems Programming
Office 03.018
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-2926
Mail: michael.engel@uni-bamberg.de
Internet: https://www.uni-bamberg.de/sysnap/
We are currently in the process of building the group and additional content will follow shortly.

AlgoK – Algorithms and Complexity Theory
Prof. Dr. Isolde Adler
Chair for Algorithms and Complexity Theory
Office 02.106
An der Weberei 5
96047 Bamberg
&
Office 03.28
Gutenbergstraße 13
96050 Bamberg
Tel.: 0951/863-3041
Mail: isolde.adler@uni-bamberg.de
Internet: https://www.uni-bamberg.de/algok/
The chair was established recently and we are excited to be starting our new group.

DT – Data Engineering
Prof. Dr. Maximilian E. Schüle
Data Engineering
Office 05.040
An der Weberei 5
96047 Bamberg
Tel.: 0951/863-2829
Mail: maximilian.schuele@uni-bamberg.de
Internet: http://www.uni-bamberg.de/en/dt
The data engineering group at university of Bamberg teaches concepts for database systems including advanced SQL for Master students, systems programming in C++ as introductory course for Bachelor and as advanced course for Master students. Within one seminar per semester for each Bachelor and Master students, we discuss current trends in database research based on conference papers.

### 2.3 Information Systems

**ISDL – Information Systems in the Service Industry**

Prof. Dr. Tim Weitzel  
Chair of Information Systems, esp. Information systems in the service industry  
Office 04.040  
An der Weberei 5  
96047 Bamberg  
Tel.: 0951/863-2870  
Mail: tim.weitzel@uni-bamberg.de  
Internet: [http://www.uni-bamberg.de/isdl](http://www.uni-bamberg.de/isdl)

The four main research areas of the ISS team are (1) Business-IT Alignment and Business Value of IT, (2) (Social) Networks and IT, (3) IT Adoption and Usage and (4) Outsourcing Management. You can find a detailed description of our research projects in the section “for researchers”. Our research results have been published in scientific journals and conferences.

**SNA – Social Networks**

Prof. Dr. Oliver Posegga  
Chair in Information Systems, esp. Social Networks  
Office 01.056  
An der Weberei 5  
96047 Bamberg  
Tel.: 0951/863-2890  
Mail: oliver.posegga@uni-bamberg.de  
Internet: [http://www.uni-bamberg.de/sna](http://www.uni-bamberg.de/sna)

We dedicate our work to research and education on the role of information systems in social networks and the use of social media (e.g. blogs, wikis) for managing knowledge within and between organizations as well as on digital transformation. We conduct theoretical and empirical research and collaborate with industry partners in these fields.
The Energy Efficient Systems Group focuses on the development of Information Systems (IS) for supporting and motivating sustainable consumer behavior. Particular consideration is given to smart metering and smart grid infrastructure and the design of related systems that enable energy efficiency services for private households. With a clear focus on the development and assessment of applications that are applicable to the mass market, the group closely works together with both, industry partners and startup companies. The research results build an important cornerstone of the teaching activities at bachelor and master level.

The Chair of Industrial Systems focuses on the design and the operation of industrial information systems, which are the backbone of production and commerce businesses. We offer courses for bachelor, master, and PHD students alike. Amongst others, our courses focus on the development and design of application systems, enterprise architecture management, electronic business, intra-organizational systems, and modular and on-demand systems.
**ISM – Information Systems Management**

Prof. Dr. Daniel Beimborn  
Chair of Information Systems, esp. Information Systems Management  
Office 01.029  
An der Weberei 5  
96047 Bamberg  
Tel.: 0951/863-2965  
Mail: daniel.beimborn@uni-bamberg.de  
Internet: http://www.uni-bamberg.de/iis

In research and teaching the Chair of ISM deals with questions concerning the management of information systems and technologies as well as with the challenges of digital innovation and transformation. The management of the information systems (IS) of an organization - consisting of those technical and personnel components, which are involved in the production, processing and use of information - is in particular in the 'age of digitization' an elementary component of successful organization management.

**ISPL – Information Systems and Digital Platforms**

Prof. Dr. Thomas Kude  
Chair of Information Systems and Digital Platforms  
Office GU13/02.06  
Gutenbergstr. 13  
96050 Bamberg  
Mail: thomas.kude@uni-bamberg.de  
Internet: https://www.uni-bamberg.de/en/wi/ispl/

Our current teaching offer includes courses on the management of digital platforms and the role of digital platforms in industries and society, as well as research seminars. The courses draw on current research insights and cover topics that are highly relevant for individuals, organizations, and policy makers.

In our research, we use qualitative and quantative methods to study digital innovation produced by collectives of organizations and individuals. For example, we study the governance and evolution of digital platforms and ecosystems in different domains, including enterprise software and mobile apps, or collaboration in teams, in particular in the context of software development.
Module Descriptions

The following appendix titled “Module Handbook – International Studies” describes in detail all modules scheduled to run during 2023-2024.

The module handbook starts with an index of all modules listed by the area of studies. In Section 1 of the list International Studies taught in English (on demand) you find all modules that are offered in English either regularly or on demand. In the latter case, since the lecture may be in German if all students are German-speaking, you need to tell the lecturer before the semester if you require English tuition. Modules listed in Section 2 of the list Exams in English on demand, though course material often in German, may sometimes be available in English are delivered in German but (again “on demand”) are examined in English if requested. To find out more information please consult the detailed module descriptions or contact the module lecturer. Within each Section the modules are organised by subject group (Applied Computer Science, Computer Science, Information Systems) and further by the name of the Teaching and Research Group who are responsible for the offering.

The index of a single module lists its acronym, its title, how many ECTS credit points it comprises, in which semester it is offered and on which page you can find its full description. For example, here is a description of the information related to the module “PSI-IntroSP-B”:

<table>
<thead>
<tr>
<th>1</th>

1. “PSI-IntroSP-B”:
   a. “PSI” stands for the research group that provides the module; in this case, this is “PSI - Privacy and Security in Information Systems Group”
   b. “IntroSP” is the short form of the module title; here, this is Introduction to Security and Privacy
“B” stands for “Bachelor” which means the module is suggested for undergraduate students. The ending “M” indicates the recommendation that the module should be attended by graduate students.

**NOTE:** International Exchange Students may attend any module offered, at undergraduate or graduate level.

2. “Introduction to Security and Privacy”: This is the title of the module
3. “6,00 ECTS”: ECTS indicate the work load for the module (see “Sec. 1.4 Workload”)
4. The module is offered every winter semester
5. The page on which you find a detailed module description.

- DSG-Project-B: Bachelor Project in Distributed Systems (6 ECTS, every summer semester) ............................ 43
- DSG-DSAM-M: Distributed Systems Architectures and Middleware (6 ECTS, every winter semester) .... 33
- DSG-Project-M: Master Project Distributed Systems (9 ECTS, every semester) ......................................................... 45
- DSG-SOA-M: Service-Oriented Architecture and Web Services (6 ECTS, every summer semester) ..... 47

**dd) Foundations of Computer Science (Subject)**

- GdI-IFP-B: Introduction to Functional Programming (6 ECTS, every winter semester) ........................................ 70
- GdI-MTL: Modal and Temporal Logic (6 ECTS, every winter semester) ............................................................ 72
- GdI-GTI-B: Machines and Languages (6 ECTS, every summer semester) .......................................................... 68

**ee) Mobile Software Systems /Mobility (Subject)**

- MOBI-ADM-M: Advanced Data Management (6 ECTS, every summer semester) ........................................ 132
- MOBI-DSC-M: Data Streams and Complex Event Processing (6 ECTS, every winter semester) ................. 134
- MOBI-PRAI-B: Bachelor Project Mobile Software Systems (AI) (6 ECTS, every summer semester) .. 136
ff) Software Technologies Research Group (Subject)

SWT-PR1-M: Masters Project in Software Engineering and Programming Languages (6 ECTS, every semester) ................................................................. 189
SWT-FPS-B: Foundations of Program Semantics (6 ECTS, every winter semester) ................................................................. 184
SWT-FSE-B: Foundations of Software Engineering (6 ECTS, every summer semester) ................................................................. 187
SWT-RSD-B: Reactive Systems Design (6 ECTS, every summer semester) ................................................................. 191
SWT-SWL-B: Software Engineering Lab (6 ECTS, every winter semester) ................................................................. 198
SWT-SEM-B: Seminar in Software Engineering and Programming Languages (Bachelor) (3 ECTS, every semester) ................................................................. 194
SWT-ASV-M: Applied Software Verification (6 ECTS, every summer semester) ................................................................. 182
SWT-SEM-M: Seminar in Software Engineering and Programming Languages (Master) (3 ECTS, every semester) ................................................................. 196
SWT-SWQ-M: Software Quality (6 ECTS, every winter semester) ................................................................. 200

c) Applied Computer Science (Subject Group)

aa) Human-Computer Interaction (Subject)

HCI-KS-B: Cooperative Systems (6 ECTS, every summer semester) ........................................................................ 78
HCI-Proj-B: Project Human-Computer Interaction (6 ECTS, every winter semester) .................................................. 84
HCI-Sem-B: Bachelor-Seminar Human-Computer Interaction (3 ECTS, every summer semester) .................................................. 94
HCI-MCI-M: Human-Computer Interaction (6 ECTS, every summer semester) .................................................. 81
HCI-Usab-M: Usability in Practice (6 ECTS, every summer semester) .................................................. 96
HCI-Proj-M: Project Human-Computer Interaction (6 ECTS, every summer semester) .................................................. 86
HCI-DISTTP-B: Design of Interactive Systems: Theory and Practice (3 ECTS, every summer semester) .................................................. 76
HCI-Proj1-M: Research-Project Human-Computer Interaction (15 ECTS, every summer semester) .................................................. 88
HCI-Proj2-M: Research-Project Human-Computer Interaction (15 ECTS, every winter semester) .................................................. 90
HCI-Prop-M: Propaedeutic: Human-Computer-Interaction (3 ECTS, every winter semester) .................................................. 92

bb) Smart Environments (Subject)
AI-KI-B: Introduction to Artificial Intelligence (6 ECTS, every summer semester) ........................................... 12
SME-Projekt-B: Bachelor's project on Smart Environments (6 ECTS, every semester) ........................................ 165
SME-Projekt-M: master project on smart environments (6 ECTS, every summer semester) ........................... 167
SME-STE-M: Introduction to Knowledge Representation: Space, Time, Events (6 ECTS, every winter semester) ........................................................................................................................................ 169

cc) Information Visualization (Subject)

VIS-IVVA-M: Advanced Information Visualization and Visual Analytics (6 ECTS, every winter semester) ........................................................................................................................................ 202
VIS-Proj-M: Master Project Information Visualization (6 ECTS, every semester) ............................................ 204
VIS-Sem-M: Master Seminar Information Visualization (3 ECTS, every semester) ........................................... 206

dd) AI Systems Engineering (Subject)

AISE-Blockseminar: Automated Theorem Proving and the TPTP (3 ECTS, winter or summer semester, on demand) ........................................................................................................................................ 14
AISE-ETH: Ethics and Epistemology of AI (6 ECTS, every summer semester) ..................................................... 16
AISE-Proj-B: Bachelorprojekt KI-Systementwicklung (6 ECTS, every winter semester) .................................. 19
AISE-ProjPrak-UR: Universal Reasoning (in Philosophy, Mathematics and Computer Science) (15 ECTS, every winter semester) ........................................................................................................................................ 22
AISE-Sem-B: Bachelorseminar Computational Philosophy (3 ECTS, every winter semester) ......................... 24
AISE-Sem-B2: Bachelorseminar Computational Philosophy (6 ECTS, every winter semester) ....................... 26
AISE-Sem-M: Masterseminar zu KI-Systementwicklung (Oberseminar) (3 ECTS, every semester) ........... 28
AISE-UL: Universal Logic & Universal Reasoning (6 ECTS, every winter semester) ........................................ 30

ee) Explainable Machine Learning (Subject)

xAI-DL-M: Deep Learning (6 ECTS, every winter semester) .................................................................................. 208
xAI-MML-M: Mathematics for Machine Learning (6 ECTS, every summer semester) ................................... 211
xAI-Proj-B: Bachelor Project Explainable Machine Learning (6 ECTS, every summer semester) ................ 214
xAI-Proj-M: Master Project Explainable Machine Learning (6 ECTS, every winter semester) ....................... 216

ff) Data Engineering (Subject)

DT-C++-B: Systems Programming in C++ (6 ECTS, every winter semester) ...................................................... 54
DT-CPP-M: Advanced Systems Programming in C++ (Master) (6 ECTS, every winter semester) .............. 55

2) Course language German, exams in English on demand, course material may be available in English (Bereich)
a) Computer Science (Subject Group)

aa) Foundations of Computer Science (Subject)
GdI-Mfl-1: Propositional and Predicate Logic (6 ECTS, every winter semester).......................... 74

bb) Distributed Systems Group (Subject)
DSG-Project-2-SoSySc-B: DSG Bachelorproject Software Systems Science (12 ECTS, every winter semester)............................................................. 41
DSG-Project-B: Bachelor Project in Distributed Systems (6 ECTS, every summer semester)........... 43
DSG-Sem-B: Bachelor Seminar in Practical Computer Science (3 ECTS, every semester)............... 50

b) Applied Computer Science (Subject Group)

aa) Media Informatics (Subject)

bb) Smart Environments (Subject)
SME-Sem-B: Bachelor seminar on Smart Environments (3 ECTS, every winter semester)............. 171
SME-Sem-M: master seminar on Smart Environments (3 ECTS, every summer semester)............. 172

c) Information Systems (Subject Group)

aa) Social Networks (Subject)
SNA-WIM-B: Knowledge- and Informationmanagement (6 ECTS, every summer semester)........... 180
SNA-ASN-M: Social Network Analysis (6 ECTS, every winter semester)........................................ 174
SNA-NET-M: Network Theory (6 ECTS, every summer semester).................................................. 176

bb) Industrial Information Systems (Subject)
IIS-Sem-B: Bachelor Seminar Industrial Information Systems (3 ECTS, every winter semester)......... 98
IIS-Sem-M: Master Seminar Industrial Information Systems (3 ECTS, every winter semester)......... 99

cc) Information Systems and Services (Subject)
ISDL-DEXP-B: Digital Experimentation (6 ECTS, every winter semester)...................................... 100

dd) Energy Efficient Systems (Subject)

ee) Information Systems Management (Subject)
ISM-IOM-M: International Outsourcing Management (6 ECTS, every winter semester).................. 102
Module AI-KI-B

Introduction to Artificial Intelligence

Einführung in die Künstliche Intelligenz

6 ECTS / 180 h
42 h Präsenzzeit
138 h Selbststudium

(since SS21)
Person responsible for module: Prof. Dr. Diedrich Wolter
further responsible: Schmid, Ute, Prof. Dr.

Contents:

Themen:

• Problemstellungen im Fachgebiet KI
• KI-Programmierung
• intelligente Agenten
• Wissensrepräsentation und Logik
• Suche im Problemraum
• maschinelles Lernen
• Wahrnehmung
• Unsicherheit
• Handlungsplanung

Learning outcomes:

• Grundlegende Konzepte und Problemstellungen der KI definieren und erklären können
• Einfache KI-Algorithmen auf konkrete – auch neue – Problemstellungen anwenden können
• Problemstellungen formal, insbesondere mit Mitteln der Logik modellieren können
• Grundzüge von KI-Programmiertechniken (insbesondere funktionale und logische Programmierung) beherrschen

Remark:

Die Vorlesung wird auf deutsch gehalten, die Folien sowie weitere Materialien sind überwiegend in englischer Sprache.

Recommended prior knowledge:

Admission requirements:

none

**Examination**

/ Duration of Examination: 105 minutes

Description:

Im Semester werden studienbegleitend Teilleistungen in der Übung ausgegeben und besprochen, deren Abgabe freiwillig ist. Ist die Klausur bestanden, so werden die bei der Bearbeitung der Teilleistungen erreichten Punkte als Bonuspunkte angerechnet. Eine 1,0 ist dabei auch ohne Punkte aus der Bearbeitung der Teilleistungen erreichbar. Die Anzahl der erreichbaren Bonuspunkte wird in der ersten Lehrveranstaltung bekanntgegeben.
Module AISE-Blockseminar Automated Theorem Proving and the TPTP

Automated Theorem Proving and the TPTP

3 ECTS / 90 h

(since SS22)

Person responsible for module: Prof. Dr. Christoph Benzmüller

Contents:
Participating students will get introduced to the TPTP World and to practical aspects and applications of automated theorem proving. The TPTP World is a well known and established infrastructure that supports research, development, and deployment of Automated Theorem Proving (ATP) systems for classical logics. The data, standards, and services provided by the TPTP World have made it increasingly easy to build, test, and apply ATP technology.

Learning outcomes:
Participating students will explore the core features of the TPTP World, learn about key service components of the TPTP World and how to use them. Students will also learn about successful applications of automated theorem proving tools and explore own applications (e.g. in AI ethics and philosophy) in group work. Moreover, students will improve their presentation skills, learn to work in teams and improve their report/paper writing skills.

Remark:
The main language of instruction in this course is English.

prerequisites for the module:
keine

Recommended prior knowledge:
Basic knowledge on AI, logic and theoretical computer science.

Admission requirements:

Module AISE-ETH Ethics and Epistemology of AI

Ethics and Epistemology of AI

| 6 ECTS / 180 h |

(since SS22)
Person responsible for module: Prof. Dr. Christoph Benzmüller

Contents:
This course takes an innovative and experimental approach to ethics with an interdisciplinary focus enabled by collaboration between the Computer Science, Engineering Science and Philosophy of Technology departments. It involves engaging with the theoretical and practical approaches that address the intersection of ethics and technology, in this case AI.

Learning outcomes:
Students will learn to critically assess the relationship between technology and society and to analyze the interactions between technology and society from an ethical perspective. Furthermore, students will deal with the deconstruction of the concept of neutrality of technology and learn to critically assess it. At the same time, the environment will be taken as a stakeholder in its own right in order to consider the impact of technological applications from a sustainability perspective.

The module will provide students with the necessary theoretical foundations stemming from both computer science (in particular AI and digital technologies) and ethics. This knowledge will be put into practice and deepened through case-based projects carried out in interdisciplinary groups. The projects will address the current challenges encountered through the use of AI technologies in different fields of application (e.g., medical, financial, social etc.), as well as discuss different implementations and possible avenues of research that could enable the development of ethically acceptable AI systems. Students will prepare a presentation of their project as well as a scientific poster.

Remark:
The main language of instruction in this course is English. The course is held in collaboration with TU Berlin (group of Prof. Dr. Sabine Ammon)

prerequisites for the module:
keine

Recommended prior knowledge:
Basic knowledge in AI, philosophy or computational humanities.

Examination Portfolio

Description:
The module examination consists of five parts:

- Text-Mind-Map (15%): Reading and presentation of a text + summary of contents through a mind-map (1 page)
- Debate Moderation (10%): Moderation of a debate
- Interim Presentation (15%): Presentation (with slides) of interim results and future work planned to achieve the project
- Final Presentation (25%): 20 min Presentation (with slides/poster) + 20 min Q&A
- Final Deliverable (35%): Depending on the project, can take the form of a short guide, website, computer program, or audio/video material + documentation of the project
Module AISE-Proj-B Bachelorprojekt KI-Systementwicklung

**Bachelorprojekt KI-Systementwicklung**

<table>
<thead>
<tr>
<th>6 ECTS / 180 h</th>
</tr>
</thead>
</table>

(since WS22/23)

Person responsible for module: Prof. Dr. Christoph Benzmüller
further responsible : Dr. Martin Aleksandrov (FU Berlin)

**Contents:**

Students will work on a project from across the spectrum of interests of the AISE research group. These research activities lie at the intersection of artificial intelligence, philosophy, mathematics, computer science, and natural language and cover topics such as:

- mechanisation of normative reasoning and explanation in computers to develop trusted AI systems
- hybrid AI systems: automated reasoning, machine learning and agent-based architectures
- AI & ethics, AI & law
- rational argumentation
- universal logical reasoning
- logico-pluralistic knowledge representation and reasoning methodologies and infrastructures
- applications: e.g. in computational metaphysics (e.g., Gödel's ontological argument), machine ethics, mathematical foundations (e.g., category theory)
- automated theorem proving (e.g. Leo theorem provers) and model finding
- interactive/automated theorem proving in research and education

**Learning outcomes:**

Building on knowledge and skills acquired in prior lectures of the AISE group, small research projects will be defined and implemented, often in group work. In the process, skills in formal modelling and systems development are developed as well as competencies in project implementation and group work.

**Remark:**

The main language of instruction in this course is English.

The entire course will meet once per two weeks for at least 4h. The projects are additionally accompanied by supervised meetings on an individual basis with each student or student group to discuss project-specific details.

**Prerequisites for the module:**

keine

**Recommended prior knowledge:**

Basic knowledge on AI, logic, theoretical computer science and mathematics; background in theoretical philosophy may also be useful.

**Admission requirements:**

ECTS-Bedingungen de

**Frequency:** every winter semester

**Recommended semester:**

**Minimal Duration of the Module:**

1 Semester

**Module Units**

**Bachelorprojekt KI-Systementwicklung: Ethics of Intelligent Vehicles**

**Mode of Delivery:**

**Lecturers:** Prof. Dr. Christoph Benzmüller

**Language:** German

| 4,00 Weekly Contact Hours |
Module AISE-Proj-B

**Frequency:** every winter semester

**Learning outcome:**
On successful completion, students will be able to

- discuss challenges (including, ethical aspects) in the development of intelligent systems
- describe and design (efficient) algorithms
- write a scientific report/paper
- review a scientific report/paper
- develop critical thinking

**Contents:**
The bachelor project addresses problems at the interface of artificial intelligence, social choice theory, intelligent vehicles, and ethics. The course gives to each student the opportunity to develop a state-of-the-art practical research project in one of (but not limited to) the following topics:

- Privacy concerns around intelligent vehicles
- Bias concerns around intelligent vehicles
- Fairness concerns around intelligent vehicles
- Algorithm designing for intelligent vehicles
- Data design for intelligent vehicles
- Applications for intelligent vehicles

Each student in the course will receive the following benefits:

- an interesting research project
- an individual supervision on their project
- a constructive feedback on their progress
- an opportunity to co-author a scientific paper
- an exposure to state-of-the-art research

The project is related to DFG project -[http://www.mi.fu-berlin.de/inf/groups/ag-ki/Projects/Fairness-and-Efficiency/index.html](http://www.mi.fu-berlin.de/inf/groups/ag-ki/Projects/Fairness-and-Efficiency/index.html)

Note on Programming Skills: Some of the projects in the course may require completing a simple experiment for which basic programming skills are required. The student could use any coding language to run the experiment. Although their programming skills will not be evaluated, their results of the experiments will be evaluated.

**Literature:**
to be announced in lecture course

**Examination**
Projekt Work, project report, a review and a presentation (all in English) / Duration of Coursework: 4 months

**prerequisites for module examination:**
Continuous attendance in the seminar sessions is mandatory, cf. §9 (10) APO.

**Description:**
The module examination consists of three parts, a project report, a review and a presentation (all in English). Each participant prepares a manuscript of their project (e.g. 10 pages) during the semester and a review of a fellow student’s manuscript (e.g. 2 page, 60 min) during the final part of the portfolio. The purpose of the presentation (max. 30 min) is to evaluate the proficiency of the student of their project, the significance and contribution of their results for the studied problem and the future directions that arise from their results.
### Module AISE-ProjPrak-UR Universal Reasoning (in Philosophy, Mathematics and Computer Science)

**Universal Reasoning (in Philosophy, Mathematics and Computer Science)**

15 ECTS / 450 h

(since WS22/23)

Person responsible for module: Prof. Dr. Christoph Benzmüller

Further responsible: David Fuenmayor, Prof. Dr. Andrea Vestrucci

#### Contents:

In this internship, students work on changing project topics related to the content of AISE courses. As a rule, aspects of several courses of the AISE group are relevant, so that teams with students who have attended different courses complement each other well. The tasks worked on in a project internship go well beyond the scope of a normal exercise task and are worked on in groups. The result is documented and presented in a final presentation.

#### Learning outcomes:

On successful completion, students will have

- produced a system implementation, or a larger piece of formalised knowledge, in an application area as relevant to the AISE group
- learned to discuss and assess challenges (including, ethical aspects) in the development of intelligent systems
- learned to write a scientific report/paper of publishable quality (in fact, ideally the project report will lead to publications)
- learned to work and interact in small research teams
- developed improved critical thinking competence

#### Prerequisites for the module:

Keine

#### Recommended prior knowledge:

Successful participation in the course AISE-UL: Universal Logic & Universal Reasoning or another course of the AISE group (depending on the special nature of the intended project work).

#### Admission requirements:

Keine

#### Frequency:

Every winter semester

#### Recommended semester:

1 Semester

Module AISE-Sem-B Bachelorseminar Computational Philosophy

 Bachelorseminar Computational Philosophy

(since WS22/23)
Person responsible for module: Prof. Dr. Christoph Benzmüller
further responsible : Prof. Dr. Andrea Vestrucci

Contents:
Gottfried Wilhelm Leibniz had a vision: human thoughts made computable. What is real, what is good, what is beautiful, what is personal identity… all facets of human thinking treated and organised as elements of calculation. This vision had a tremendous multi-part impact which the seminar shall follow: It fostered the development of machines to calculate (“ordinateur”, the French word for “computer,” is what makes order out of chaos); It influenced the so-called analytical approach in philosophy, treating propositions formally; And it established the basis for the science “prior to all others” (K. Gödel), i.e., mathematical logic. This seminar in Computational Philosophy will embrace these three aspects. It will study how, and how far, thinking and algorithm are one thing, and can impact each other. It will ask why Leibniz’s vision has not become reality: What are the computational limits of human thought? What are the (philosophical) limits of computation? And, more importantly, what is left to do? What are the future directions on the path of making our thinking computable, and a machine thinking?

Learning outcomes:
Via the application of AI programs, we will explore the above questions and try to formulate our answers. We will, for instance, discuss current interpretations of AI limits; we will deepen the relationship between Gödel’s incompleteness theorems and Turing’s halting problem; we will explore metaphysical arguments, belief changes, and ethical problems in an automated reasoning environment.

Remark:
The main language of instruction in this course is English.

prerequisites for the module:
Basic knowledge on AI, theoretical computer science and cognitive science; some background in theoretical philosophy is also useful.

### Module AISE-Sem-M Masterseminar zu KI-Systementwicklung (Oberseminar)

**Masterseminar zu KI-Systementwicklung (Oberseminar)**

<table>
<thead>
<tr>
<th>3 ECTS / 90 h</th>
</tr>
</thead>
</table>

(since SS22)

Person responsible for module: Prof. Dr. Christoph Benzmüller

**Contents:**

This seminar covers selected topics from across the spectrum of interests of the AISE research group. These research activities lie at the intersection of artificial intelligence, philosophy, mathematics, computer science, and natural language and cover topics such as:

- mechanisation of normative reasoning and explanation in computers to develop trusted AI systems
- hybrid AI systems: automated reasoning, machine learning and agent-based architectures
- AI & ethics, AI & law
- rational argumentation
- universal logical reasoning
- logico-pluralistic knowledge representation and reasoning methodologis and infrastructures
- applications: e.g. in computational metaphysics (e.g., Gödel's ontological argument), machine ethics, mathematical foundations (e.g., category theory)
- automated theorem proving (e.g. Leo theorem provers) and model finding
- interactive/automated theorem proving in research and education

**Learning outcomes:**

Participating students will be introduced to current research questions and papers from the AISE group's spectrum of interest. Students will explore, prepare and present a selected topic and acquire in depth knowledge about the involved research questions and challenges. Ideally, this work will lead to a subsequent topic for a thesis project. Presentations of research topics related to a running thesis project are also welcome. Students will learn to assess and review research papers and to prepare and present own papers.

**Remark:**

The main language of instruction in this course is English.

In addition to the contributions by participating students there will presentations by PhD students and guest researchers.

**prerequisites for the module:**

keine

**Recommended prior knowledge:**

Basic knowledge on AI, logic, theoretical computer science and mathematics; background in theoretical philosophy may also be useful. Ideally participants have attended at least one prior course of the AISE group.

Module AISE-UL Universal Logic & Universal Reasoning
Universelle Logik & Universelles Schließen

(since WS22/23)
Person responsible for module: Prof. Dr. Christoph Benzmüller

Contents:
Knowledge representation and reasoning applications in computer science, AI, philosophy and math typically employ very different logic formalisms. Instead of a "single logic that serves it all" (as envisioned already by Leibniz) an entire "logic zoo" has been developed, in particular, during the last century. Logics in this zoo, e.g., include modal logics, conditional logics, deontic logics, multi-valued logics, temporal logics, dynamic logics, hybrid logics, etc. In this lecture course we will introduce, discuss and apply a meta logical approach to universal logical reasoning that addresses this logical pluralism. The core message is this: While it might not be possible to come up with a universal object logic as envisioned by Leibniz, it might in fact be possible to have a universal meta logic in which we can semantically model, analyse and apply various species from the logic zoo. Classical higher order logic (HOL) appears particularly suited to serve as such a universal meta logic, and existing reasoning tools for HOL can fruitfully be reused and applied in this context.

Learning outcomes:
The participants of this course will, in combination with a hands-on introduction to Isabelle/HOL, learn about HOL, about semantical embeddings (SSE technique) of non-classical logics in HOL, and about proof automation of these logics in Isabelle/HOL. They will conduct practical exercises regarding the application of the SSE technique in philosophy, mathematics or artificial intelligence, including, normative reasoning and machine ethics.

Remark:
The main language of instruction in this course is English.
The overall workload of 180h for this module consists of:

- weekly classes: 22h
- tutorials: 8h
- Work on assignment: 90h
- Literature study 40h
- preparation for and time of the final exam: 20h

prerequisites for the module:
none

Recommended prior knowledge:
Basic knowledge about classical and non-classical logics, theoretical computer science.

Frequency: every winter semester

Recommended semester:

Admission requirements:
non

Minimal Duration of the Module:
1 Semester

Contents:
This course introduces students to the ideas, benefits, technologies and issues related to server-centric distributed systems and middleware in general. The core topics are centered around component technologies such as Java EJBs, Business-to-Business technologies like EDI and ebXML, and Cloud Computing facilities like Google App Engine and Windows Azure. Thus the course introduces and discusses in-depth topics concerning distributed middleware and its practical use:

- Characteristics and Foundations of Distributed Systems
- Classical Middleware and Services
- Concurrency and Synchronization
- Component Technologies
- Cloud Computing, in particular platform as a service
- Business-to-Business Technologies

The selection of topics and teaching method of this course reflects the Distributed Systems Group's (DSG) dedication to integrate business and IT, theory and practice, research and teaching. You not only will be taught the classical way, but you will have hands-on experience on middleware development and middleware tools. Also, you will get the chance to discuss selected publications with your lecturers.

Learning outcomes:
Students are able to evaluate, plan, design and implement server-centric distributed systems. Students are familiar with recent approaches and standards for building and managing such systems, know about the central problems involved as well as ways to overcome these issues. Students have hands-on experience with up-to-date middleware and tools for building server-centric systems.

Remark:
The main language of instruction in this course is English.

prerequisites for the module:
Basic knowledge in software engineering and in distributed systems as introduced, e.g., in the module DSG-IDistrSys-B (or DSG-DistrSys-M).

Recommended prior knowledge:
Basic knowledge in software engineering and in distributed systems as introduced, e.g., in the module DSG-IDistrSys.

**Examination**

Coursework Assignment and Colloquium / Duration of Examination: 15 minutes  
Duration of Coursework: 3 months  

**Description:**  
Oral examination concerning the topics discussed in the lecture, exercises and assignment. **Students may choose English or German as the language for the oral examination.** Examinations will take place at the end of the winter term or at the begin of the summer term (students may choose one of them).  
Students are assumed to work on a programming assignment ('schriftliche Hausarbeit') during the semester that is introduced at the beginning of the semester and uses the most important technologies discussed during the semester.  

**Note:** Without working on the programming assignment over the term students may run into problems during their oral examination (Kolloquium) as we discuss questions concerning topics from the lectures as well as from the assignment; questions about the assignment are based on the assignment solution programmed by the students.
### Module DSG-DistrSys-M Distributed Systems

**Distributed Systems**

6 ECTS / 180 h  
45 h Präsenzzeit  
135 h Selbststudium  

(since SS20)  
Person responsible for module: Prof. Dr. Guido Wirtz  

#### Contents:

Nowadays infrastructure and business relies more or less on distributed systems of various flavors. Most of our civilization would not work any more if all distributed systems would fail. So, that should be a good reason for anyone planning to work in the context of IT to learn at least about the characteristics and basic issues of such systems. The course introduces to the different flavors of and issues with distributed systems, discusses the most basic problems arising with this kind of systems and presents solutions and techniques that are essential to make distributed systems work. Additionally, the course also teaches how to build simple distributed systems using Java-based technologies like process interaction, synchronization, remote message invocation and web service infrastructure. Students are required to work (in groups) on assignments in order to combine the theoretical concepts with practical experience and ...  
Yes, we program!

#### Learning outcomes:

Students know about the characteristics and different flavors of distributed systems and understand the essential differences compared to monolithic, centralized systems as well as their consequences when designing and building distributed systems. Students are able to apply the basic algorithmic techniques and programming paradigms in order to build simple distributed systems themselves. Students have gained basic experience with practically building and running distributed systems.

#### Remark:

The language of instruction in this course is English.

The overall workload of 180h for this module consists of:

- weekly classes: 22.5h  
- tutorials: 22.5h  
- Work on assignment: 75h  
- Literature study 30h  
- preparation for and time of the final exam: 30h

This course is intended for 2nd/3rd year bachelor students as well as master students which have not enrolled in a similar course during their bachelor studies. In case of questions don’t hesitate to contact the person responsible for this module.

#### Prerequisites for the module:

none

#### Recommended prior knowledge:

Knowledge of the basics of computer science in general, esp. operating systems, as well as practical experience in Java programming, as the subjects taught in DSG-EiAPS-B and DSG-EiRBS-B. Preferable also knowledge about multithreading and synchronization like, e.g., the subject-matters of DSG-PKS-B.  
Module Introduction to Parallel and Distributed Programming (DSG-PKS-B) - recommended

#### 2. Tutorial Distributed Systems

**Mode of Delivery:** Practicals  
**Lecturers:** Scientific Staff Praktische Informatik  
**Language:** German  
**Frequency:** every summer semester

**Learning outcome:**  
c.f. module description

**Contents:**
Introduction to and discussion of tools and practical issues closely related to the topics discussed in the lecture as well as solutions of problems that come up during working on the practical assignment.

### Examination

**Coursework Assignment and Colloquium / Duration of Examination:** 15 minutes  
**Duration of Coursework:** 3 months  
**Description:**
Oral examination concerning the topics discussed in the lecture, exercises and assignment. **Students may choose English or German as the language for the oral examination.** Examinations will take place at the end of the summer term or at the begin of the winter term (students may choose one of them).

Students are assumed to work on a programming assignment ('schriftliche Hausarbeit') during the semester that is introduced at the beginning of the semester and uses the most important technologies discussed during the semester.
Note: Without working on the programming assignment over the term students may run into problems during their oral examination (Kolloquium) as we discuss questions concerning topics from the lectures as well as from the assignment; questions about the assignment are based on the assignment solution programmed by the students.
Module DSG-IDistrSys-B

Introduction to Distributed Systems

6 ECTS / 180 h
45 h Präsenzzeit
135 h Selbststudium

(since SS20)
Person responsible for module: Prof. Dr. Guido Wirtz

Contents:
Nowadays infrastructure and business relies more or less on distributed systems of various flavors. Most of our civilization would not work any more if all distributed systems would fail. So, that should be a good reason for anyone planning to work in the context of IT to learn at least about the characteristics and basic issues of such systems. The course introduces to the different flavors of and issues with distributed systems, discusses the most basic problems arising with this kind of systems and presents solutions and techniques that are essential to make distributed systems work. Additionally, the course also teaches how to build simple distributed systems using Java-based technologies like process interaction, synchronization, remote message invocation and web service infrastructure. Students are required to work (in groups) on assignments in order to combine the theoretical concepts with practical experience and ... Yes, we program!

Learning outcomes:
Students know about the characteristics and different flavors of distributed systems and understand the essential differences compared to monolithic, centralized systems as well as their consequences when designing and building distributed systems. Students are able to apply the basic algorithmic techniques and programming paradigms in order to build simple distributed systems themselves. Students have gained basic experience with practically building and running distributed systems.

Remark:
The language of instruction in this course is English.

The overall workload of 180h for this module consists of:

- weekly classes: 22.5h
- tutorials: 22.5h
- Work on assignment: 75h
- Literature study 30h
- preparation for and time of the final exam: 30h

This course is intended for 2nd/3rd year bachelor students as well as master students which have not enrolled in a similar course during their bachelor studies. In case of questions don't hesitate to contact the person responsible for this module.

prerequisites for the module:
none

Recommended prior knowledge:
Knowledge of the basics of computer science in general, esp. operating systems, as well as practical experience in Java programming, as the subjects taught in DSG-EiAPS-B and DSG-EiRBS-B. Preferable also knowledge about multithreading and synchronization like, e.g., the subject-matters of DSG-PKS-B.

Learning outcomes:

Remark:
Dieses Modul erstreckt sich über 2 Semester (Start im Wintersemester): 2\times 6 = 12 ECTS, 2\times 4 = 8 SWS.
Der Arbeitsaufwand beträgt insgesamt 360 Std., welche sich grob wie folgt gliedern:
• 60 Std. Recherche, Planung und Teilnahme am Planungsworkshop
• 40 Std. Teilnahme an Projekttreffen, einschließlich Tutorien
• 180 Std. Durchführung des Projekts (Projektarbeit)
• 20 Std. Erstellung des Zwischenberichts (Hausarbeit)
• 60 Std. Erstellung des Abschlussberichts, sowie Erstellung und Präsentation des Projektposters (Hausarbeit und Kolloquium)

prerequisites for the module:
none

Recommended prior knowledge:
Grundlegende methodische Kenntnisse zur Planung und Durchführung von Softwareprojekten und zum wissenschaftlichen Arbeiten, sowie Grundkenntnisse in der Programming paralleler und verteilter Systeme

Admission requirements:
none

- **Kolloquium:** Fachliche Diskussion auf der Grundlage des im Projekt bearbeiteten Themas im Rahmen einer Abschlussveranstaltung, auf der zunächst das zum Projekt angefertigte Poster erläutert wird; hier können auch praktische Projektergebnisse (z. B. lauffähige Software) demonstriert werden.

**Hausarbeit:** Anfertigen eines schriftlichen Abschlussberichts in Deutsch oder Englisch nach abgeschlossener Projektarbeit.

Die Gewichtung der Prüfungsleistungen wird zu Beginn des Semesters bekannt gegeben.
Module DSG-Project-B Bachelor Project in Distributed Systems

Bachelorprojekt zur Praktischen Informatik

(since WS18/19)
Person responsible for module: Prof. Dr. Guido Wirtz

Contents:

Learning outcomes:
Studierende sollen ein vertieftes Verständnis der bei der Durchführung von praktischen, arbeitsteilig organisierten, Softwareprojekten auftretenden Probleme wie auch von erfolgversprechenden Lösungsansätzen zu diesen Problemen erhalten. Da dies anhand der intensiven Bearbeitung eines Themas aus dem Forschungsbereich der praktischen Informatik geschieht, gewinnen die TeilnehmerInnen wichtige Erfahrungen mit der Durchführung kleinerer, forschungsorientierter Projekte von der Grobkonzeption über die Detailplanung bis hin zur Umsetzung und Dokumentation der Ergebnisse in einem wissenschaftlich ausgerichteten Arbeitsbericht.

Remark:
Der Arbeitsaufwand von insgesamt 180 Std. gliedert sich in etwa in:

- 50 Std. Einführung, Vorstellen von Werkzeugen, Vorträge zum Projektstand
- 30 Std. Recherchen zu und Einarbeitung in Thematik des Praktikums inkl. Vorbereitung von Kurzvorträgen
- 80 Std. praktische Projektarbeit (Softwareentwicklung)
- 10 Std. Abfassen des Projektberichts
- 10 Std. Vorbereitung auf und Zeit für das Kolloquium (unter o.g. schon erbrachten Aufwänden)

prerequisites for the module:
none

Recommended prior knowledge:
Programmierkenntnisse sowie Kenntnisse in den Grundlagen des im Projekt behandelten Themengebiets.
Modul Einführung in Algorithmen, Programmierung und Software (DSG-EIAps-B) - empfohlen

## Module DSG-Project-M Master Project Distributed Systems

*Masterproject Distributed Systems*

(since SS19)

Person responsible for module: Prof. Dr. Guido Wirtz

### Contents:

Within the project, a comprehensive topic in the field of system development in group work. Students work on problems that also arise in practice, with the most independent solution possible of a larger one, only conditionally solvable task in partly concretely given basic conditions. The Master-Project differs from the project work in the Bachelor's programme in the complexity of the task and the direct relation to current scientific work of the chair.

### Learning outcomes:

- Ability to independently develop solutions to problems on the basis of the acquired knowledge and the acquired skills from their studies as well as current scientific literature;
- Ability to solve complex problems within the framework of a systematic engineering development process into software and to document it professionally;
- Ability to teamwork;
- Scientific curiosity and the formation of a self-confident and researching attitude towards technology.

### Remark:

Compilation of a written project report, a poster on the project result and the existence of the verbal attestation of the project result.

The workload of 270 hours in total (as a block according to the respective SoSe) is roughly divided into:

- 35 hrs. introduction, presentation of tools, short lectures
- 30 hours of research on and familiarization with the topic of the project including preparation of Short presentations
- 180 hours practical project work (software development)
- 15 hours of writing the project report and creating the joint poster
- 10 hours of preparation for the certificate (under the above-mentioned expenses already incurred)

### Prerequisites for the module:

none

### Recommended prior knowledge:

The module builds on the DSG-DistrSys-M or DSG-IDistrSys-B (Introduction to) Distributed Systems module. Depending on the topic, also the previous visit to one of the events DSG-SOA-M or DSG-DSAM-M (to be announced at Theme announcement).

Students of the subject are expected to master a higher (object-oriented) programming language and the Readiness for practical work on the computer expected.

Modules Introduction to Distributed Systems (DSG-DistrSys-B)

Module Einführung in Verteilte Systeme (DSG-EiDistrSys) -

### Admission requirements:

none

**Mode of Delivery:** Practical  
**Lecturers:** Prof. Dr. Guido Wirtz, Scientific Staff Praktische Informatik  
**Language:** English  
**Frequency:** every semester  

**Learning outcome:**  
see module description

**Contents:**  
Building on the knowledge gained in the lectures and exercises in the Distributed systems is presented in this event and the knowledge and skills acquired implemented a smaller project with scientific reference in a group  
After a short introduction to the technologies used and tools will be developed in a project with different working groups/packages organized form a related problem from the field of distributed and mobile systems. Usually this involves a prototype of a complex distributed software system or tool consisting of in this area.

**Literature:**  
depends on the project topic

**Examination**  
Coursework Assignment and Colloquium / Duration of Examination: 10 minutes  
Duration of Coursework: 3 months  
**prerequisites for module examination:**  
regular participation in the course and working in groups on the assignments  

**Description:**  
Report on the own contribution made to the project as clearly identified  
Part of the general report of the project group; collaboration in the preparation of a Poster demonstration of the project results.  
Oral examination discussion about the contents of the project, in particular the conceptual and practical work done by the respective student Services.
Module DSG-SOA-M Service-Oriented Architecture and Web Services
Service-Oriented Architecture and Web Services

6 ECTS / 180 h
45 h Präsenzzeit
135 h Selbststudium

(since SS20)
Person responsible for module: Prof. Dr. Guido Wirtz

Contents:
Building enterprise-scale IT systems requires sound concepts for integrating software. Service-oriented architectures (SOAs) have been the number one answer to this integration challenge for years. Indeed, service orientation is and will be a cornerstone in modularizing large IT landscapes and alignment with business needs is the driving factor for service engineering. A SOA composes an IT system from services in a loosely-coupled manner. Each service implements a business task and therefore have a clear value attribution. When business needs change, the loose coupling of services allows for quick adjustment of the SOA. In recent years, Microservices have been put forward as a new paradigm for organizing software-intensive systems as a set of small services that communicate using lightweight communication technologies and are independently deployable by fully automated deployment machinery. Conceptually, Microservices and SOA share a lot, but the Microservices paradigm puts a lot more emphasis on automation in development and therefore is a better fit for modern development practices.

When moving beyond company boundaries and opening up the solution space is necessary, software ecosystems (SECOs) come into play. Software ecosystems integrate software contributions from independent organizational entities and enable software products and solutions that a single company cannot realize alone. Prominent representatives of software ecosystems are Android and the Playstore or iOS and the AppStore. But the paradigm of software ecosystems goes far beyond mobile platforms and also covers application areas in the cloud domain or the embedded domain.

Skilled software architects therefore reconcile the business views and technical views for the benefit of the enterprise and therefore need both, advanced knowledge in business process and workflow management as well as a rock-solid understanding of service engineering and distributed computing.

This course will introduce you to the world of architectures for large-scale software by giving a brief overview on distributed systems and software architecture in general. Then SOAs as an architectural paradigm and Web Services (WSDL + REST) as SOA implementation technology will be treated in detail. SOA will be contrasted to Microservices and the development aspects that Microservices focuses on will be discussed. Software ecosystems then will be introduced as a paradigm for organizing software systems and container technology (Linux Containers (LXC) and Docker) as a frequent implementation means for software ecosystems will be introduced. In particular, we will investigate what building industry-grade ecosystems based on container technology means in practice.

- Conceptual Foundations of SOA
- SOA Characteristics
- Microservices
- WSDL and Basic Web Services
- REST-ful Services
- Software Ecosystems
- Container technology

The selection of topics and teaching method of this course reflects the Distributed Systems Group’s (DSG) dedication to integrate business and IT, theory and practice, research and teaching. You not only will be taught the classical way, but you will have hands-on experience on service development and SOA tools.
Also, you will get a grasp of current services research and you will get the chance to discuss selected publications with your lecturers.

**Learning outcomes:**
Students know about the different aspects of service-oriented architectures and their practical use.

- Understand the characteristics of SOAs, Microservices and SECOs and its implications on IT systems.
- Know relevant technologies and standards in the field and being able to combine some of these to develop basic Web Services and service compositions.
- Being able to compare WSDL Web Services to REST Web Services.
- Being able to use container technology for integrating software.
- Being able to judge IT architectures from a SOA/Microservices/SECO perspective.
- Being able to understand and discuss scientific work in the area.

**Remark:**
The main language of instruction in this course is English.

The overall workload of 180h for this module consists of:

- weekly classes: 22.5h
- tutorials: 22.5h
- Work on assignment: 75h
- Literature study 30h
- preparation for and time of final exam: 30h

**Prerequisites for the module:**
Basic knowledge in software engineering and in distributed systems as introduced, e.g., in the modules DSG-IDistrSys-B or DSG-DistrSys-M.

**Recommended prior knowledge:**

*Masterseminar zu Verteilten Systemen*  

<table>
<thead>
<tr>
<th>ECTS / h</th>
<th>3 ECTS / 90 h</th>
</tr>
</thead>
</table>

(since SS20)  
Person responsible for module: Prof. Dr. Guido Wirtz

**Contents:**  
This module is intended to offer an in-depth study of specific topics in distributed systems that go well beyond the topics discussed in DSG-DistrSys-M, DSG-SOA-M or DSG-DSM-M. We try to close the gap between 'standard' lecture topics often dealing with the (required) basics and the state-of-the-art related to a specific research question regarding distributed systems in general, SOC and SOA, server-side middleware, process languages, as well as questions w.r.t. standard conformance, interoperability and correctness based on 'ground-breaking' as well as up-to-date research papers from international journals and/or conferences.

**Learning outcomes:**  
Students will learn how to read and work on research papers, how to present their essence as an outline talk to colleagues (students) and how to guide discussion sessions based on scientific talks. Students will be able to classify and compare results from papers in the context of a specific research question. Moreover, students will become proficient in the developments of the specialized research area that is the topic of the particular course.

**Remark:**  
The seminar will regularly be taught in English.

**prerequisites for the module:**  
none

**Recommended prior knowledge:**  
Basic knowledge about distributed systems as offered, e.g., by the course *DSG-IDistrSys-B* oder *DSG-DistrSys-M* or similar knowledge. Dependend on the topic of the specific seminar, additional knowledge as discussed in DSG-SOA-M or DSG-DSAM-M may be helpful (ask if in doubt before enrolling in the course)

**Admission requirements:**  
none

**Frequency:**  
every semester

**Recommended semester:**  
2

**Minimal Duration of the Module:**  
1 Semester

Module EESYS-ADAML-M Applied Data Analytics and Machine Learning in R  

6 ECTS / 180 h

(since SS21)
Person responsible for module: Prof. Dr. Thorsten Staake

Contents:
This course provides the theoretical foundation and conveys hands-on skills in the fields of data analytics and machine learning using the statistics software GNU R. It uses real-word datasets from the realm of energy efficiency and consumer behavior and conveys the subject matter through real-world examples and practical challenges.

Following a refresher in descriptive statistic, the course covers

• an introduction to the statistics software GNU R,
• the design of field experiments and the use of Information Systems to collect behavioral data,
• techniques to formulate, solve, and interpret linear and logistic regression analyses,
• techniques to formulate, solve, and interpret clustering analyses,
• setting up, training, and evaluating machine learning algorithms, including KNN, regression, and support vector machines, and
• ethical issues and data privacy regulations.

Learning outcomes:
After a successful participation in this course, participants can

• translate new business and research questions that can be answered using empirical methods into suitable experimental designs,
• plan and conduct corresponding experiments,
• choose suitable methods from the set of methods presented in class to analyze the data,
• explain their design choices, the choice of methods, and the steps of the analyses,
• apply the methods correctly and efficiently using the statics software R,
• adjust the methods if needed to solve new and specific problems based on an understanding of the necessary theories,
• interpret the outcome of such analyses and identify the strengths and limitations of the approaches, and
• reflect upon data protection, privacy and ethical issues related to powerful techniques for data acquisition and analytics.

Remark:
The lecture will be held as a self-paced, video-based online lecture.

The tutorials take place once per week as in-classroom events.

The online lecture includes instructional videos (scripted, i.e., with subtitles), reading material, exemplary data sets, and a multitude of online and offline tasks. It also includes an online discussion forum.

The online lecture is supported by three classroom lectures (in addition to the classroom tutorials):

1. Classroom lecture: The introductory event includes a course overview and motivation. Moreover, credentials to access the online resources will be announced. Date: First week of the semester.
Module EESYS-ADAML-M

2. Classroom lecture: This intermediate session includes a review of the concepts covered so far. It should help participants to self-assess their learning progress. Date: Announced in the first week of the semester.

3. Classroom lecture: Exam preparation and Q&A. Date: Last week of the semester.

An introduction to the statistics software GNU R will be given as in-classroom event during the tutorials at the beginning of the semester.

prerequisites for the module:
none

Recommended prior knowledge:
This course requires a basic understanding of statistics (e.g., from a bachelor-level course). A statistics repetition and is part of the online material of the course and the of the first tutorials and should be complemented in self-study if necessary.

Basic familiarity with a programming language.

Admission requirements:
none

prerequisites for the module:

Module Units

1. Lectures Data Analytics in Energy Informatics

Mode of Delivery: Lectures

Lecturers: Prof. Dr. Thorsten Staake

Language: German/English

Frequency: every winter semester

Contents:
The video-based online lecture is divided into two parts. Part 1 conveys the statistical basics required for the module, including, for example, properties of random distributions and descriptive and injunctive statistics. This part serves as refresher of bachelor-level statistics and thereby enables students with no statistics-knowledge beyond a basic introductory course to participate. Part 2 covers the methods outlined in “Module EESYS-DAE-M” subsection “Contents”. It includes both, the theory behind the concepts and their application using R. Both, Part 1 and Part 2 use datasets and examples from industry and research and provides many hands-on examples. In order to deepen the understanding and to ease the transfer of the methods to new problems and settings, mini-tasks and small exercises are part of the online lecture.

Literature:
Reading material will be announced in class.

2. Practicals Data Analytics in Energy Informatics

Mode of Delivery: Practicals

Language: German/English

Frequency: every winter semester

Contents:
In the classroom tutorial, participants apply the methods, tools, and theories conveyed in the lecture to exemplary problems and to new challenges. This includes solving smaller tasks (e.g., acing case studies, working on concrete
data problems) on paper and using the statistics software GNU R. Tasks are addressed individually or in small teams.

The tutorials can also cover new content, especially when its immediate application supports the learning process. Selected tutorials contain a self-assessment of the learning progress.

An introduction to GNU R is given in the first sessions.

---

**Examination**

Written examination / Duration of Examination: 90 minutes

**Description:**

The examination covers subject matter taught in the lectures and tutorials. The examination can also cover transfers of the subject matter to new problems and settings. Students can achieve up to 90 points.

Through the voluntary completion of coursework ("bonus exercises") during the semester, participants can collect up to 12 additional points that are counted towards the exam, given that the exam is passed also without points from bonus exercises. Bonus exercises can take the form of written assignments, presentations, or smaller software projects. Points from bonus exercises are only valid in the semester they have been earned in and in the immediately following semester. In the first week of the course, the publishing dates of bonus exercise tasks, the submission deadlines, and the points per bonus exercise will be announced. It is possible to pass the exam with a grade of 1.0 also without points from bonus exercises.

Exam questions are stated in English, answers can be given in German or English.
Module EESYS-BIA-M Business Intelligence & Analytics

**Business Intelligence & Analytics**

<table>
<thead>
<tr>
<th>(since SS21 to SS21)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Person responsible for module: Dr. Konstantin Hopf</td>
</tr>
</tbody>
</table>

**Contents:**
This module covers topics from the field of Business Intelligence, Data Science, and Business Analytics and introduces data-driven decision support. The main topics include:

- the role of Business Intelligence in organizations,
- the data analytics process using the CRISP-DM process model,
- data sources in organizations and publicly available data sources,
- an introduction to Data Science and the basics of data analytics including a repetition of the fundamentals of descriptive statistics and data visualization,
- fundamentals of spatio-temporal data analysis,
- advanced analytics methods including unsupervised and supervised machine learning, optimization and simulation, and
- legal and ethical aspects of data analytics (in particular privacy, data security and copyright).

Students approach the topics by means of concrete data analytics examples and case studies in the programming environment GNU R. The course covers the most important steps of the data analytics process (business understanding, data understanding, data preparation, modeling, evaluation and deployment).

**Learning outcomes:**
Students will be able to

- describe the role of business intelligence and data analyses in organizations,
- identify available internal and publicly available data sources, make them usable and describe the data,
- apply advanced analytics methods (especially: k nearest neighbor, Decision Trees, Support Vector Machines, Random Forest) in the software R on their own and create analyses for business-relevant questions, which can be used as a basis for decision-making,
- visualize the results of the analyses in a meaningful way, and
- describe selected ethical and legal aspects of data analytics.

**prerequisites for the module:**
none

**Recommended prior knowledge:**
This course requires a basic understanding of statistics (e.g., from a bachelor-level course). A statistics repetition is part of the course and should be complemented in self-study if necessary.

Basic familiarity with a programming language.

**Frequency:** every winter semester

**Recommended semester:**

**Admission requirements:**
none

**Minimal Duration of the Module:**
1 Semester

Module EESYS-ES-M Energy Efficient Systems
Energieeffiziente Systeme

6 ECTS / 180 h

(since WS19/20)
Person responsible for module: Prof. Dr. Thorsten Staake

Contents:
The course covers the design and application of Information Systems that help increase energy efficiency and reduce greenhouse gas emissions. It is directed to computer science and Information Systems students that want to apply their skills to challenges in the fields of energy, mobility, production, and sustainable consumption/consumer behavior.

The course introduces methods and theories from behavioral economics, operations management, and simulation analysis that help to understand, analyze, and shape both, industry processes and consumer behavior in the field of sustainability. Also covered are cost/benefit considerations on a micro- and macro-level (including, for example, rebound effects) and a discussion on the economic and societal implications of the subject matter.

The course includes an introduction to physics and energy engineering to allow students with very limited knowledge in these fields to participate successfully.

Learning outcomes:
Successful participants of this course shall acquire the skills to

• explain the physical and technical principals covered in this course and apply them to new problems,
• explain the components, influencing factors, requirements and challenges related to electric mobility and describe the contribution that Information Systems can make to solve the challenges; moreover, successful participants shall be able to set up data-based simulations to derive important characteristic variables related to electric vehicles, such as electric reachability, peak loads to electric grids, etc.,
• outline, assess, and conceptually model the potential of Information Systems and the effects to heating and room climate applications,
• explain in detail the characteristics of and implications from environmental business Information Systems,
• explain the discussed behavioral theories (e.g., the prospect theory), make use of them when building Information Systems that support decision making and behavioral change, and be able to evaluate the effectiveness of such systems, and
• evaluate the effects of the tools and methods introduced, including their micro- and macro-economic effects, and critically assess the techniques used to perform such evaluations.

Moreover, successful participants shall be able to apply the acquired skills to new challenges and adjust and extend them as needed.

Finally, the participants shall realize the scope for design and the potential that results from their IT studies to favorably shape a sustainable and socially desirable development of our society.

Module EESYS-IITP-B International IT Project Management

Internationales IT-Projektmanagement

(since WS19/20)
Person responsible for module: Prof. Dr. Thorsten Staake

Contents:
This course provides its participants with the knowledge they need to manage and support IT projects. It covers the entire project lifecycle from scoping to planning, executing, controlling, and closing projects and discusses both, traditional (e.g., waterfall- and V-models) and agile (e.g., Scrum) management techniques. The course addresses issues that are relevant for small, agile companies in unstable environments as well as for multinationals with well-established processes. Special attention is paid to the management of international projects and international teams.
Throughout the course, care is taken to combine hands-on advice about tools, techniques, and management practices with insights about the concepts’ theoretical foundations, strengths, and limitations.

Learning outcomes:
After successfully completing this course, students are well-equipped with sound methods to plan, execute, and manage IT projects in small and large organizations. They are also able to support local and international teams. Moreover, based on a solid theoretical background, successful participants are able to apply the methods and tools to new settings and problems and develop them further if it is required.

Remark:
The course is organized as classroom lecture with the exception that three to four lecture units are available exclusively online. The online lectures include scripted videos, references to literature and tasks that can be completed online.
The tutorial will be held as classroom event.

Module GdI-GTI-B

**Machines and Languages**

*Grundlagen der Theoretischen Informatik*

6 ECTS / 180 h

(since WS18/19)

Person responsible for module: Prof. Ph.D. Michael Mendler

**Contents:**

This course addresses the questions "what is a computation?" and "what is an algorithm?" and explores the capabilities and limitations of computers and programming languages as well as the implication of these for a practical computer scientist. It introduces the basic concepts and methods that underlie the mathematical study of computing machines and formal languages.

**Learning outcomes:**

At the end of this course the students should be able to distinguish finite automata, pushdown automata, Turing machines, and know the difference between the deterministic and non-deterministic versions in each case; be able to distinguish regular, context-free, context-sensitive and general phrase structure grammars in the Chomsky Hierarchy; understand the relations between language classes and machine classes; have developed elementary automata and Turing machine programming skills; know the basic concepts of algorithmic complexity theory such as the big-O notation and key complexity classes such as N and NP as well as their relationship.

**Remark:**

The language of instruction in this course is German. However, all course materials (lecture slides and tutorial notes) as well as the exam are available in English.

**prerequisites for the module:**

None.

**Recommended prior knowledge:**

Elementary concepts in logic and discrete mathematics for computer scientists; Basic programming skills; English language skills at Level B2 (UniCert II) or above.

Module Introduction to Algorithms, Programming and Software (DSG-EiAPS-B) - Module Propositional and Predicate Logic (GdI-Mfl-1) - recommended

**Frequency:** every summer semester

**Recommended semester:**

**Minimal Duration of the Module:** 1 Semester

   Through prepared class presentations and direct interactions with the students the lecturer introduces the topics of the course in detail, poses exercises and suggests literature for self-study.
Literature:

2. Machines and Languages
Mode of Delivery: Practicals
Lecturers: Prof. Ph.D. Michael Mendler, N.N.
Language: English/German
Frequency: every summer semester

Contents:
The tutorials deepen the students' understanding of the theoretical concepts and constructions covered in the lectures through practical exercises. Participants are given the opportunity to present their solutions to homework question sheets and sample solutions are given by the lecturer for selected exercises. The tutorials also provide exam preparation.

Examination
Written examination / Duration of Examination: 90 minutes
Description:
90 min written examination. The exam takes place during the regular exam period after the end of the semester. An alternative oral exam may be negotiable for guest students only.
# Module GdI-IFP-B

**Introduction to Functional Programming**  
6 ECTS / 180 h  
(since WS19/20)  
Person responsible for module: Prof. Ph.D. Michael Mendler

### Contents:

The aim of this module is to provide an introduction to functional programming using Haskell. This course develops both elementary practical programming skills and discusses the typed lambda calculus and its role as an operational semantics for functional programming, stressing the importance of types and type checking for static program analysis.

### Learning outcomes:

At the end of this course students should be familiar with important language constructs of Haskell and their semantics (e.g., expressions, local declarations, higher-order function abstraction, recursion, lazy and eager evaluation, referential transparency, algebraic data types, monads); be able to use these language concepts to solve algorithmic problems; be familiar with the lambda calculus as an operational semantics behind functional programming; understand the difference between imperative and declarative programming styles; have an appreciation of the close relationship between programming language types and specification and the role of type checking as a static program analysis method; be familiar with polymorphic Hindley-Milner style type systems.

### Remark:

The main language of instruction in this course is English. However, the lectures and/or tutorials may be delivered in German if all participating students are fluent in German.

### Prerequisites for the module:

none

### Recommended prior knowledge:

Elementary concepts in logic and discrete mathematics for computer scientists; Basic programming skills; English language skills at Level B2 (UniCert II) or above.

Module Introduction to Algorithms, Programming and Software (DSG-EiAPS-B) - recommended  
Module Propositional and Predicate Logic (GdI-MfI-1) - recommended

90 min written examination. The exam takes place during the regular exam period after the end of the semester.
Module GdI-MTL Modal and Temporal Logic

Modal and Temporal Logic

6 ECTS / 180 h

(since WS21/22)

Person responsible for module: Prof. Ph.D. Michael Mendler

Contents:
This advanced module aims to give a thorough introduction to a selection of modal logics with strong applications in Computer Science. Basic knowledge of classical propositional logic and predicate logic and associated calculi is assumed as a prerequisite. Among the logics covered are modal and temporal logics for the analysis of distributed systems or semantic information processing. Depending on the time available, the module also covers belief logics and other specialised logics for security protocols and distributed algorithms. The course addresses theoretical foundations (models and proof systems) but also discusses applications and offers practical experience through hands-on experimentation with automatic and interactive verification tools.

Learning outcomes:
At the end of the course students should understand the commonalities and differences between propositional and predicate logics on the one hand and modal logics on the other for system specification and modelling; be aware of the important role played by modal logics for the trade-off between expressiveness and automation; know the semantical foundations of modal logics based on Kripke structures; understand the difference between epistemic, temporal, deontic modalities; be familiar with basic results from modal correspondence theory with modal theories such as K, S4, S5; know the Hennessy-Milner Theorem, model filtration and minimation techniques; apply standard reasoning procedures based on Hilbert, Gentzen Sequent and Tableau calculi; be familiar with the syntax and semantics of important temporal logics such as PLTL, CTL and description logics such as ALC; be able to apply deduction and model-checking techniques for the specification and verification of distributed and dynamic systems as well as semantic information processing.

Remark:
The main language of instruction in this course is English. However, the lectures and/or tutorials may be delivered in German if all participating students are fluent in German.

prerequisites for the module:
none

Recommended prior knowledge:
Elementary logic and discrete mathematics for computer scientists; Basic programming skills.

Module GdI-Mfl-1 Propositional and Predicate Logic
Mathematik für Informatik 1 (Aussagen- u. Prädikatenlogik)

6 ECTS / 180 h

(personal name)

Contents:
This module gives an introduction to basic constructions in the proof theory and model theory of propositional and typed predicate logic. It provides the necessary logical foundations for many computer science courses which use mathematical formalisations and deductive methods and/or directly use symbolic reasoning in applications.

Learning outcomes:
At the end of this course students should be able to perform elementary calculations in algebraic structures such as Boolean, functional and relational algebras; be familiar with the concept of a formal system and formal calculus and have understood the fundamental difference between syntax and semantics, soundness and completeness; be able to formalize real-world concepts in propositional and predicate logic and have developed skills in reasoning using formal calculi for these logics; be able to apply elementary proof principles (proof by contraposition, proof by cases, natural and structural induction); be familiar with the concept of types and logical signatures for static specification and language formalisation.

Remark:
The main language of instruction in this course is German. However, all course materials (lecture slides and tutorial notes) as well as the exam are available in English.

prerequisites for the module:
none

Recommended prior knowledge:
English language skills at Level B2 (UniCert II) or above.

Admission requirements:

Contents:
Die Übung vertieft die Konzepte und Konstruktionen aus der Vorlesung an konkreten Beispielen. Sie dient damit auch der Klausurvorbereitung.

Examination
Written examination / Duration of Examination: 90 minutes

2,00 Weekly Contact Hours
## Module HCI-DISTP-B Design of Interactive Systems: Theory and Practice

### Design Interaktiver Systeme: Theorie und Praxis

| 3 ECTS / 90 h |

(since WS17/18 to WS23/24)

Person responsible for module: Prof. Dr. Tom Gross

| Contents: |

Theoretical, methodical, practical foundation of design and practical design with focus on a research challenge.

| Learning outcomes: |

The aim of this module is a general introduction to basic practical skills, processes, and methods of design with a special application-oriented focus on the user-centred design of complex interactive systems.

| Remark: |

http://www.uni-bamberg.de/hci/leistungen/studium

The workload for this module is roughly structured as following:

- Attendance of the lecture units
- Participation in the group meetings
- Work on the tasks alone and with the team
- Preparation of discussions and presentation
- Exam preparation

The workload for each participant may vary over the different tasks based on the task definitions and the joint coordination of tasks in the team

The default language of instruction is German and can be changed to English based on students' needs. All course materials (incl. exams) are available in English

| prerequisites for the module: |

none

| Recommended prior knowledge: |

none

| Admission requirements: |

Minimal Duration of the Module: 1 Semester

### Module Units

| Design of Interactive Systems: Theory and Practice |

Mode of Delivery: Lectures and Practicals

Lecturers: Jochen Denzinger

Language: German/English

Frequency: every summer semester

| Contents: |

In this lecture the following topics are covered:

- Design theory and history
- Design of multimodal user interfaces
- User-Centred Design, User-Experience Design
- Practical design, incl. practical application of methods for the iterative design

| 1,00 Weekly Contact Hours |

76
The assignments cover diverse topics based on the contents of the course. The practical part includes an iterative design as an assignment. The task is significantly more comprehensive than the normal assignments accompanying the lectures and therefore is solved in a small group. The results are documented and demonstrated in a final presentation.

**Literature:**
The course is based on a compilation of different sources; as additional sources and as a reference are recommended:

**Examination**
Colloquium / Duration of Examination: 30 minutes

**Description:**
Colloquium on the assignment process and results
**Module HCI-KS-B Cooperative Systems**  
*Kooperative Systeme*  

<table>
<thead>
<tr>
<th>6 ECTS / 180 h</th>
</tr>
</thead>
</table>

(since WS21/22)  
Person responsible for module: Prof. Dr. Tom Gross

**Contents:**  
Theoretical, methodological, and practical foundation of Computer-Supported Cooperative Work.

**Learning outcomes:**  
The aim of this module is to teach advanced paradigms and concepts of computer-supported cooperative work (CSCW) and the resulting design principles and prototypes. Hereby a broad perspective on the topic is applied; accordingly a central concern is the general technological support of social interaction, spanning cooperative work and learning as well as leisure activities.

**Remark:**  
http://www.uni-bamberg.de/hci/leistungen/studium

The workload for this module is roughly structured as following:

- Attendance of the lectures and assignments: 45 hours
- Credits of the lecture (incl. research and study of additional sources): ca. 30 hours
- Credits of the assignments (incl. research and study of additional sources, but without optional homework assignment): ca. 30 hours
- Solving the optional homework assignments: overall ca. 45 hours
- Exam preparation: ca. 30 hours (based on the above mentioned preparation and revision of the subject material)

The default language of instruction is German and can be changed to English based on students' needs. All course materials (incl. exams) are available in English

**prerequisites for the module:**  
none

**Recommended prior knowledge:**  
Basic knowledge in computer science to the extent of an introduction to algorithms, programming and software, as well as programming skills in Java.

**Admission requirements:**  
Passing the written exam

**Frequency:** every summer semester  
**Recommended semester:**  
**Minimal Duration of the Module:** 1 Semester

**Contents:**  
After an introduction into the subject the following topics are covered in this lecture:

- Basic concepts

| 2,00 Weekly Contact Hours |
- Technological support for mutual awareness, communication, coordination, collaboration, and online communities
- Analysis of cooperative environments
- Design of CSCW and groupware systems
- Implementation of CSCW and groupware systems
- CSCW in a broader context and related topics

**Literature:**
The course is based on a compilation of different sources; as additional sources and as a reference are recommended:

**Examination**
Oral examination

**Description:**
The oral exam takes 30 minutes and is worth a total of 90 points. Depending on the number of attendees the form of the exam can be changed to a written exam with 90 minutes and a total of 90 points. The final form of the exam is announced in the first lecture at the beginning of the term.

During the semester students can do assignments, which are optional. They are 12 points in total. The type of optional homework assignments as well as the deadlines are announced in detail at the beginning of the term. If the oral exam is passed (as a rule 50% of the points have to be reached) the points from the assignments are a bonus and added to the points from the oral exam. In any case, a top grade of 1.0 is also reachable without solving the assignments.

**Examination**
Written examination / Duration of Examination: 90 minutes

**Description:**
In Abhängigkeit der Teilnehmerzahl wird die Modulprüfung entweder in Form einer Klausur oder in Form einer mündlichen Prüfung durchgeführt. Die Festlegung erfolgt zu Semesterbeginn und wird im ersten Lehrveranstaltungstermin bekannt gegeben.

In der Klausur über 90 min. können 90 Punkte erzielt werden. Es besteht die Möglichkeit, optionale Studienleistungen zu erbringen. Diese umfassen insgesamt 12 Punkte. Die Art der optionalen Studienleistungen sowie deren Bearbeitungsfrist werden zu Beginn der Lehrveranstaltung verbindlich bekannt gegeben. Ist die Prüfung bestanden (in der Regel sind hierzu 50 % der Punkte erforderlich), so werden die durch optionale Studienleistungen erreichten Punkte als Bonuspunkte angerechnet. Eine 1,0 ist in der Prüfung auf jeden Fall auch ohne Punkte aus der Bearbeitung optionaler Studienleistungen erreichbar.
Module HCI-MCI-M Human-Computer Interaction
Mensch-Computer-Interaktion

6 ECTS / 180 h

(since WS21/22 to SS23)
Person responsible for module: Prof. Dr. Tom Gross

Contents:
Advanced theoretical, methodological, and practical foundation of Human-Computer Interaction

Learning outcomes:
The aim of this module is to teach advanced knowledge and skills in the area of human-computer interaction as well as a broad theoretical and practical methodological expertise concerned with the design, conception, and evaluation of ubiquitous systems. Students of this course learn the relevant literature and systems in breadth and depth and are later able to critical review new literature and systems.

Remark:
http://www.uni-bamberg.de/hci/leistungen/studium

The workload for this module is roughly structured as following:

- Attendance of the lectures and assignments: 45 hours
- Credits of the lecture (incl. research and study of additional sources): ca. 30 hours
- Credits of the assignments (incl. research and study of additional sources, but without optional homework assignment): ca. 30 hours
- Solving the optional homework assignments: overall ca. 45 hours
- Exam preparation: ca. 30 hours (based on the above mentioned preparation and revision of the subject material)

## Module HCI-Usab-M Usability in Practice

*Usability in der Praxis*

<table>
<thead>
<tr>
<th>6 ECTS / 180 h</th>
</tr>
</thead>
</table>

(since WS17/18)

Person responsible for module: Prof. Dr. Tom Gross

### Contents:
Practical work on a real-world topic of Human-Computer Interaction.

### Learning outcomes:
In this course the knowledge and skills obtained in the human-computer interaction lectures and assignments are applied in practice. Based on real use cases from industry contexts students will analyse the usability of existing concepts and systems and gather requirements for innovative concepts. Central to this course is the development of skills regarding the practical application of methods as well as competencies regarding project management and teamwork.

### Remark:
http://www.uni-bamberg.de/hci/leistungen/studium

The workload for this module is roughly structured as following:

- Participation in the kick-off meeting
- Participation in the group meetings
- Work on the tasks alone and with the team
- Preparation of discussions and presentation
- Exam preparation

The workload for each participant may vary over the different tasks based on the task definitions and the joint coordination of tasks in the team.

The default language of instruction is German and can be changed to English based on students' needs. All course materials (incl. exams) are available in English.

<table>
<thead>
<tr>
<th><strong>Usability in der Praxis</strong></th>
</tr>
</thead>
</table>

**Mode of Delivery:** Practical

**Lecturers:** Prof. Dr. Tom Gross, Scientific Staff Mensch-Computer-Interaktion

**Language:** German/English

**Frequency:** every summer semester

**Contents:**
The course covers diverse topics from human-computer interaction that are cooperatively solved with companies. They typically range from specifying challenges to selecting and applying methods as well as analysing the captured data to deriving conclusions. The task is significantly more comprehensive than
the normal assignments accompanying the lectures and therefore is solved in a small group. The results are documented and demonstrated in a final presentation.

**Literature:**
To be announced in the course

**Examination**
Coursework Assignment and Colloquium / Duration of Examination: 30 minutes
Duration of Coursework: 4 months

**prerequisites for module examination:**
regelmäßige Teilnahme an der Lehrveranstaltung

**Description:**
Documentation on the project process and results as well as colloquium on the project process and results.
## Module IIS-Sem-B Bachelor Seminar Industrial Information Systems

*Bachelorseminar Industrielle Informationssysteme*

<table>
<thead>
<tr>
<th>3 ECTS / 90 h</th>
</tr>
</thead>
</table>

(since WS17/18)

Person responsible for module: Prof. Dr. Sven Overhage

### Contents:

Seminar with changing topics in industrial information systems. The specific seminar topic will be announced by the examiner at the beginning of the winter semester.

### Learning outcomes:

none

### Remark:

The main language of instruction in this course is German. The exam may be delivered in English on demand.

### prerequisites for the module:

none

### Recommended prior knowledge:

Module ISDL-DEXP-B Digital Experimentation

<table>
<thead>
<tr>
<th>Digital Experimentation</th>
<th>6 ECTS / 180 h</th>
</tr>
</thead>
</table>

Person responsible for module: Dr. Christoph Weinert

Contents:
Durch das Internet kamen sogenannte Online-Experiment auf, die gerade von großen Tech-Konzernen wie Google, Facebook oder Alibaba genutzt werden, um Produkte und Dienstleistungen zu evaluieren. Darüber hinaus können Experimente dabei helfen sozialen und wirtschaftlichen Aktivitäten, an denen sich Menschen online beteiligen besser zu verstehen. Das liegt daran, dass Experimente sowohl in der Forschung als auch in der Praxis eine exzellente Möglichkeit sind, um Reiz-Reaktions-Beziehungen abzubilden und untersuchen zu können. In einem Experiment wird ein Reiz bewusst manipuliert, um die darauffolgenden Reaktionen messen zu können während die Kontextvariablen stabil gehalten oder kontrolliert werden. Die Durchführung von Experimenten hat eine lange Historie in den Naturwissenschaften, allerdings wird diese Methode immer häufiger in die Praxis und Forschung der Wirtschaftsinformatik eingesetzt.

Learning outcomes:

Remark:
Der Arbeitsaufwand für dieses Modul gliedert sich ungefähr wie folgt:

- Teilnahme an Vorlesung und Übung: insgesamt 42 Stunden
- Vor- und Nachbereitung der Vorlesung und Übung (inkl. Recherche und Studium zusätzlicher Quellen): 56 Stunden
- Bearbeiten der Übungsaufgaben: insgesamt 40 Stunden
- Prüfungsvorbereitung inkl. Prüfung: 42 Stunden (basierend auf dem bereits im obigen Sinne erarbeiteten Stoff)

Weitere Literatur wird in der Vorlesung bekannt gegeben.

### Examination
Written examination / Duration of Examination: 90 minutes

**prerequisites for module examination:**
keine

**Description:**
In der Klausur werden die in der Vorlesung und Übung behandelten Inhalte geprüft. Es können 90 Punkte erzielt werden. Durch die freiwillige Abgabe von semesterbegleitenden Studienleistungen (Planung und Durchführung eines Experiments) können Punkte zur Notenverbesserung gesammelt werden, die auf die Klausur anrechenbar sind, sofern die Klausur auch ohne Punkte aus Studienleistungen bestanden ist. Zu Beginn der Lehrveranstaltung wird bekannt gegeben, ob Studienleistungen angeboten werden. Falls Studienleistungen angeboten werden, wird zu diesem Zeitpunkt auch die Anzahl, die Art, der Umfang und die Bearbeitungsdauer der Studienleistungen sowie die Anzahl an erreichbaren Punkten pro Studienleistung bekannt gegeben. Eine Bewertung von 1,0 kann auch ohne Punkte aus den Studienleistungen erreicht werden.
Module ISM-IOM-M International Outsourcing Management

International Outsourcing Management

6 ECTS / 180 h

(since WS20/21)
Person responsible for module: Prof. Dr. Daniel Beimborn

Contents:

- Grundlagen des Outsourcings: Definitionen, grundlegende Konzepte und Arten von Outsourcing; Geschichte, Trends; Märkte und Wachstum; Überblick über die wissenschaftliche Forschung im Outsourcing-Kontext
- Outsourcing-Gründe und grundlegende Theorien: Ökonomische und strategische Gründe für Outsourcing; Theorien zu Kosten- und strategischen Vorteilen, Kernkompetenzen usw.
- Outsourcing-Risiken: Ökonomische und strategische Risiken durch Outsourcing
- Outsourcing-Entscheidungen: Analyse der Nutzenpotenziale und Risiken durch Outsourcing; Modelle zur Bewertung der Vorteilhaftigkeit von Outsourcing; Prozess und Bewertungskriterien zur Auswahl von Dienstleistern
- Outsourcing-Verträge: Gestaltung und Verhandlung von Outsourcing-Verträgen und Service-Level-Agreements; Verhandlung mit einem Dienstleister; ausgewählte regulatorische Rahmenbedingungen
- Organisatorische Vorbereitungen im eigenen Unternehmen („Outsourcing Readiness“); Vorbereitung und Durchführung des Transitionsvorgangs
- Outsourcing-Governance: Aufbau einer Outsourcing-Governance zur Steuerung der Dienstleisterbeziehung; Kontrolle, Change-Management und Beziehungsmanagement; Management des Wissensaustausches und Fördern von Innovationen
- Offshore- und Nearshore-Outsourcing: Besonderheiten hinsichtlich Risiken, Kosten und Chancen; Bedeutung von und Umgang mit kulturellen Unterschieden; Globale IT-Delivery-Modelle
- Ökonomische und gesellschaftliche Auswirkungen von Outsourcing und Offshoring: Gesellschaftliche Reaktionen und Veränderungen; Implikationen für nationale Arbeitsmärkte und globale IT-Märkte

Learning outcomes:

Die Teilnehmer können Chancen und Risiken von IT-Outsourcing in Firmen identifizieren, Outsourcing-Projekte planen (Outsourcing-Strategie, Business Case, Auswahl unterschiedlicher Sourcing-Modi und Vendorenmodelle) und implementieren (Vertragsmanagement, Outsourcing-Governance, Beziehungsmanagement, Wissenstransfer). Damit sind Sie in der Lage,

- die grundlegenden Argumente für das Treffen von IT-Outsourcing-Entscheidungen zu identifizieren und zu evaluieren (Wann macht Outsourcing Sinn?),
- IT-Outsourcing-Optionen zu identifizieren und zu bewerten (Welche Form von Outsourcing ist sinnvoll?),
- IT-Outsourcing-Projekte zu planen und zu managen (Wie kann ein erfolgreicher Transfer zum Dienstleister gewährleistet werden?),
- eine Outsourcing-Governance zu implementieren (Wir wird gesteuert? Wer hat welche Verantwortlichkeiten inne?),
- IT-Outsourcing-Beziehungen zu gestalten und zu managen (Vertragsmanagement, Kontrolle, Beziehungsmanagement, Wissenstransfer) sowie
Nearshore- und Offshore-IT-Outsourcing-Optionen zu identifizieren und zu bewerten.

**Remark:**
Der Arbeitsaufwand für dieses Modul gliedert sich ungefähr wie folgt:

- Teilnahme an Vorlesung und Übung: insgesamt 45 Stunden
- Vor- und Nachbereitung der Vorlesung und Übung (inkl. Recherche und Studium zusätzlicher Quellen): 90 Stunden
- Prüfungsvorbereitung inkl. Prüfung: 45 Stunden (basierend auf dem bereits im obigen Sinne erarbeiteten Stoff)

Für das erfolgreiche Absolvieren des Moduls ist die regelmäßige Teilnahme an den Lehrveranstaltungen und die Vorbereitung von Fallstudien/Readings empfohlen.

Managing Digital Platforms

(since SS23)
Person responsible for module: Prof. Dr. Thomas Kude

Contents:
Digital platforms are ubiquitous in industries and in society and both researchers and practitioners have recognized their disruptive potential. Large technology companies, such as Apple, Alibaba, Amazon, or SAP, rely on a platform business model and the emergence of the thriving platform economy has contributed to the meteoric rise of some platform owners to top the lists of the most valuable companies in the world. The central actors in the context of digital platforms include the platform owner that provides the platform itself along with interfaces and other resources, outside third-party actors that provide complementary products and services, as well as the users of the platform. For example, in the context of mobile app ecosystems, complementors can leverage platform functionality of iOS or Android to create apps and use Apple’s App Store or the Google Play Store to offer them to iPhone or Android users.

In this course, we develop a comprehensive understanding of the management of digital platforms through an in-depth exploration of the roles and mechanisms of digital platforms and the surrounding ecosystems. After laying the foundations of digital platform management, we will dive into advanced questions of platform design and management, e.g., related to platform launch, to governing third-party contributions, or to key success factors for the various actors in digital platform ecosystems. The course relies on both theoretical insights and practical cases across industries and companies.

Learning outcomes:
After the course, participants will be able to...

- Recognize the growing importance of digital platforms
- Analyze the underlying mechanisms and the roles of different actors in digital platform ecosystems
- Make decisions regarding the governance of different types of platforms
- Develop strategies and business models for complementor organizations that benefit from and depend on digital platforms

Remark:
The required workload of 180h is subdivided into:

- 56h for participation in lecture and exercise
- 124h for preparation and post-processing of sessions as well as exam preparation

prerequisites for the module:
none

Recommended prior knowledge:
Good command of the English language

Admission requirements:
none

Frequency: every summer semester
Recommended semester: 1 Semester

Minimal Duration of the Module: 1 Semester

Module Units

1. Managing Digital Platforms
Mode of Delivery: Lectures
Lecturers: Prof. Dr. Thomas Kude
Language: English

2,00 Weekly Contact Hours
### Frequency:
every summer semester

### Contents:
In the lecture, we will work on central topics of managing platform ecosystems, including, but not limited to:

- Foundations of digital platforms
- Launching and monetizing digital platforms
- Digital platform governance
- The role of complementors in digital platforms

### Literature:
The specific literature that we will use in the course will be communicated or distributed in class or through the learning platform (VC). Students may have to purchase cases.

### 2. Managing Digital Platforms

<table>

<tr>
<td>Lecturers:</td>
<td>Prof. Dr. Thomas Kude</td>
</tr>
<tr>
<td>Language:</td>
<td>English</td>
</tr>
<tr>
<td>Frequency:</td>
<td>every summer semester</td>
</tr>
</tbody>
</table>

### Contents:
In the exercise, we will deepen and practice the content of the lecture through examples and case discussions, some of which will be done in groups.

### Examination

**Written examination**

**Description:**
The exam questions will include the content from lecture, exercises, and assignments. Students can reach 90 points in the exam. Students may obtain additional points to improve their grade though the voluntary participation in group or individual assignments. These points can be included in the exam points if a student would pass the exam without the additional points. The respective assignments, the available time, and the points that can be reached in each assignment will be communicated if and once such voluntary assignments are offered. The best grade (1,0) can be reached without participating in the voluntary assignments.
Module KTR-GiK-M Foundations of Internet Communication
Grundbausteine der Internet-Kommunikation

<table>
<thead>
<tr>
<th>6 ECTS / 180 h</th>
<th>45 h Präsenzzeit</th>
</tr>
</thead>
<tbody>
<tr>
<td>135 h Selbststudium</td>
<td></td>
</tr>
</tbody>
</table>

(since SS20)
Person responsible for module: Prof. Dr. Udo Krieger

Contents:
The course provides an introduction to the theoretical foundations of important technical issues related to the fundamentals of Internet communication, the data link layer, routing and transport protocols in IP networks, as well as advanced topics such as real-time communication and security in IP networks. The implementation of the learnt concepts in terms of predetermined configuration tasks in the communication laboratory by small teams of students constitutes the tutorial part of the course. For this purpose, guidelines, technical instructions, and tools will be provided.

The implementation tasks include the configuration and testing of computer networks in the laboratory setting. Operating system and required software components like Wireshark, Atheris and Vyatta software router will be provided. The basic handling of the hardware and software itself will be performed by the students as part of their individual intellectual efforts within the course.

Learning outcomes:
The important skill to provide a qualified assessment of current communication technologies and corresponding practical knowledge can only be acquired by team-oriented processes subject to time constraints and the clear specification of technical and administrative objectives. In the course Foundations of Internet Communication and its tutorials in the router laboratory students will learn to work independently with a high level of responsibility as self-confident member of a successful team.

It is the objective of the course that the students acquire practical knowledge on modern data communication in Internet and learn how communication concepts can be developed, implemented and judged with the highest level of expertise.

The course is open to bachelor students in their transition phase to the master program. It attempts to prepare for the job in communication industry related fields. Master students in the first semester and exchange students from abroad are invited to join the course.

Remark:
The module can be selected by exchange students and master students speaking only English.

The workload is composed of the following items:
- participation in lectures, tutorials in the laboratory, laboratory meetings: 45 hours
- preparation, execution, post-processing of lectures and tutorials in the laboratory: 100 hours
- preparation of the examination: 35 hours

prerequisites for the module:
none

Recommended prior knowledge:
- data communication similar to module KTR-Datkomm-B
- fundamental knowledge on programming in JAVA (or C++)
- working knowledge on LINUX is recommended, but not assumed

Module Algorithms and Data Structures (AI-AuD-B) - recommended

Admission requirements:
governed by examination regulations (StuFPO)
Module KTR-GIK-M

Module Introduction to Algorithms, Programming and Software (DSG-EiAPS-B) - recommended
Module Data communication (KTR-Datkomm-B) - recommended

<table>
<thead>
<tr>
<th>Frequency: every summer semester</th>
<th>Recommended semester:</th>
<th>Minimal Duration of the Module: 1 Semester</th>

</thead>
</table>

Module Units

**Foundations of Internet Communication**

**Mode of Delivery:** Lectures and Practicals

**Lecturers:** Prof. Dr. Udo Krieger

**Language:** English/German

**Frequency:** every summer semester

**Learning outcome:**

The important skill to provide a qualified assessment of current communication technologies and corresponding practical knowledge can only be acquired by team-oriented processes subject to time constraints and the clear specification of technical and administrative objectives. In the course Foundations of Internet Communication and its tutorials in the router laboratory students will learn to work independently with a high level of responsibility as self-confident member of a successful team.

It is the objective of the course that the students acquire practical knowledge on modern data communication in Internet and learn how communication concepts can be developed, implemented and judged with the highest level of expertise.

The course is open to bachelor students in their transition phase to the master program. It attempts to prepare for the job in communication industry related fields. Master students in the first semester and exchange students from abroad are invited to join the course.

**Contents:**

The course provides an introduction to the theoretical foundations of important technical issues related to the fundamentals of Internet communication, the data link layer, routing and transport protocols in IP networks, as well as advanced topics such as real-time communication and security in IP networks. The implementation of the learnt concepts in terms of predetermined configuration tasks in the communication laboratory by small teams of students constitutes the tutorial part of the course. For this purpose, guidelines, technical instructions, and tools will be provided.

The implementation tasks include the configuration and testing of computer networks in the laboratory setting. Operating system and required software components like Wireshark, Atheris and Vyatta software router will be provided. The basic handling of the hardware and software itself will be performed by the students as part of their individual intellectual efforts within the course.

The organization of the laboratories is following the framework of industry. It comprises definition, preparation, implementation and presentation phases. An incremental processing is performed like in industrial projects. It means:

- a segmentation into specific work packages,
• its division into tasks and subtasks including milestones
• the presentation of intermediate results
• a final report with presentation

Further laboratories related to current research issues in “Future Generation Internet” will be integrated into the course on demand. Details are discussed in the first lecture.

An actual list of studied topics and related references are presented in the first lecture.

The language of the course will be announced during the first lecture.

Literature:
Foundations:

Further references related to specific workpackages:
• Flaig, G., u.a.: Internet-Telefonie, Open source Press, München, 2006.

An up-to-date list is provided by the course.

Examination
Coursework Assignment and Colloquium / Duration of Examination: 30 minutes
Duration of Coursework: 4 months

Description:
The evaluation of the course will take place after completion of all lectures within the examination cycle. It is based on following items:
• assessment of the chapters composed by the candidate in the final course report about all workpackages written by a team of students
• presentation and explanation of specific tasks and outcomes of laboratories by an individual colloquium lasting 30 minutes

The evaluation rules of these components will be announced during the first lecture. The overall individual grading has to reach the level "satisfactory/ausreichend (4.0)" to pass the examination of the module.

The language of the examination will be announced during the first lecture.
Module KTR-MAKV-M Modeling and Analysis of Communication Networks and Distributed Systems

<table>
<thead>
<tr>
<th>Modellierung und Analyse von Kommunikationsnetzen und Verteilten Systemen</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 ECTS / 180 h</td>
</tr>
<tr>
<td>45 h Präsenzzeit</td>
</tr>
<tr>
<td>135 h Selbststudium</td>
</tr>
</tbody>
</table>

(since WS17/18)
Person responsible for module: Prof. Dr. Udo Krieger

Contents:
The course deals with the analysis and performance evaluation of complex distributed systems such as telecommunication systems, computer networks and complex networks as well as cloud computing systems. The latter are transformed to abstract system-theoretical models and their associated parameters. The models are used to analyze the system behavior, and to predict relevant performance metrics such as utilization, throughput, waiting and response times of request, person or data flows in distributed systems or social networks. Such predictions have great importance regarding economic or technical design and decision processes in future generation networks and their distributed service architectures.

The course presents the modeling of distributed systems and discusses associated description methods such as relevant load and machine models. The system-theoretical analysis of these models and the included resource assignment and management strategies are sketched based on simple analytic methods like Markov chains, algebraic and numerical solution methods for queueing models.

Learning outcomes:
It is the objective of the course to teach students the fundamentals of measurement, analysis, and performance evaluation methods in modern computer and communication networks, and distributed systems. Students will learn how they can apply the underlying system-theoretical monitoring, modeling, and analysis techniques to a given technical context. The application of the sketched models and methods is illustrated by exercises covering views of distributed systems with a realistic characteristic. Students are encouraged to apply a given methodology to new technical contexts and scientific tasks.

Remark:
The module can be selected by exchange students and master students speaking only English.

prerequisites for the module:
none

Recommended prior knowledge:
- solid knowledge of calculus (like Mathematik I) and linear algebra (like Mathematik für Informatik 2)
- basic knowledge of probability theory and statistics
- programming experience in JAVA (or C++)

Admission requirements:
governed by examination regulations (StuFPO)

Frequency: every summer semester

Recommended semester: 1 Semester

Minimal Duration of the Module: 1 Semester

Module KTR-MMK-M Multimedia Communication in High Speed Networks
Multimedia-Kommunikation in Hochgeschwindigkeitsnetzen

(since WS17/18)
Person responsible for module: Prof. Dr. Udo Krieger

Contents:
Based on the foundations of data communication, this advanced course of the master program presents
the design of high-speed networks (HSN) and the advanced protocol elements of the signaling and
user plane that are required to implement new real-time and multimedia services. It includes the digital
switching technologies and protocol stacks of HSNs, the quality-of-service architectures, as well as the
traffic management protocols of these next generation IP networks. The extension of the TCP/IP protocol
stack to realize communication relations among mobile or stationary end systems that are supported by
quality-of-service guarantees and associated improved switching concepts are discussed in detail by
lectures of the course.

These lectures focus on effective access technologies and new transport and QoS-architectures in the
core network like Diffserv, MPLS and GMPLS. Further, enhancement of IPv4 by IPv6 switching and the
extension of TCP by modern multipath concepts such as MPTCP and SCTP are presented. Advanced
QoS-management concepts, effective resource and traffic management schemes like buffer management
by RED, RIO or scheduling by WFQ, are discussed, too. Furthermore, we present new architectures for
next generation networks (NGNs) such as software-defined networks and information-centric networks.

Modern multimedia service architectures with interactive applications for third to fourth generation Internet
like Web applications based on HTTP 2.0, WebRTC, peer-to-peer VoIP and media streaming applications
are sketched.

The course can be supplemented by the module Foundations of Internet Communication (KTR-GIk-M) with
its instructive tasks executed in the router laboratory, by master seminars and projects or a master thesis
on related topics in next generation networks.

Learning outcomes:
The students will be enabled to work independently according to the highest scientific standards on
design and analysis tasks associated with high-speed network protocols. They will learn about the
fundamentals of multimedia communication in high-speed networks and the systematic analysis of
the applied communication algorithms by means of an interactive tutorial concept. They will assess
the implementations of existing network protocols and to evaluate their performance by means of a
measurement analysis with Wireshark and other tools. The processing of the design, assessment,
measurement, and implementation tasks will be performed by teams of students. Thus, learning effective
teamwork is part of the course.

Remark:
The module can be selected by exchange students and master students
speaking only English.

45 h Präsenzzeit  
135 h Selbststudium

(since SS20)  
Person responsible for module: Prof. Dr. Udo Krieger

### Contents:

The course presents the fundamentals of mobile communication. We sketch the underlying standards, system architectures and their realizations as well as current research and development trends. Due to the complexity of the field the course can only present some basic important aspects of those mobile communication systems that exhibit the strongest growth in the markets and affect all business areas of the information societies at most. The course will focus on the technical system and design perspectives regarding the service architectures and local or wide area mobile communication networks.

The following topics are discussed in detail:

- technical foundation of wireless transmission
- media access control protocols
- resource management protocols in mobile communication networks (including resource assignment strategies at the radio layer, handoff management, error control protocols, scheduling etc.)
- mobility support at the network layer by mobile IP
- transport protocols and their enhancements
- wireless LANs and their development (IEEE802.11 standards, WiMAX etc.)
- wireless wide area networks based on TDMA technology (GSM basics and protocols, GPRS)
- data communication in wireless wide area networks (UMTS, HSPA, LTE, LTE-A etc.)
- service architectures for mobile networks (including Android programming and WebRTC architectures)

### Learning outcomes:

The students are encouraged to independent scientific work. They learn the fundamentals of mobile communication and are trained to analyze the applied protocols and communication algorithms in a systematic manner. Students are instructed to investigate the sketched mobile communication protocols by measurements using Wireshark and other tools, to evaluate their performance, and to develop new protocol elements. The processing of design, programming, and performance assessment tasks by teams of students and the effective arrangement of workgroups is part of the training.

### Remark:

The module can be selected by exchange students and master students speaking only English.

### prerequisites for the module:

none

### Recommended prior knowledge:

- substantial knowledge of the foundations of data communication similar to module KTR-Datkomm-B  
- good knowledge of programming in JAVA (or C++)  
- knowledge of algorithms and data structures similar to module MI-AuD-B

Module Algorithms and Data Structures (AI-AuD-B) - recommended  
Module Advanced Java Programming (DSG-AJP-B) - recommended

### Admission requirements:

governed by examination regulations (StuFPO)
### Module Data communication (KTR-Datkomm-B) - recommended

#### Mobile Communication Course

**Mode of Delivery:** Lectures and Practicals  
**Lecturers:** Prof. Dr. Udo Krieger  
**Language:** English/German  
**Frequency:** every winter semester

**Learning outcome:**
The students are encouraged to independent scientific work. They learn the fundamentals of mobile communication and are trained to analyze the applied protocols and communication algorithms in a systematic manner. Students are instructed to investigate the sketched mobile communication protocols by measurements using Wireshark and other tools, to evaluate their performance, and to develop new protocol elements. The processing of design, programming, and performance assessment tasks by teams of students and the effective arrangement of workgroups is part of the training.

**Contents:**
The course presents the fundamentals of mobile communication. We sketch the underlying standards, system architectures and their realizations as well as current research and development trends. Due to the complexity of the field the course can only present some basic important aspects of those mobile communication systems that exhibit the strongest growth in the markets and affect all business areas of the information societies at most. The course will focus on the technical system and design perspectives regarding the service architectures and local or wide area mobile communication networks.

The following topics are discussed in detail:
- technical foundation of wireless transmission  
- media access control protocols  
- resource management protocols in mobile communication networks (including resource assignment strategies at the radio layer, handoff management, error control protocols, scheduling etc.)  
- mobility support at the network layer by mobile IP  
- transport protocols and their enhancements  
- wireless LANs and their development (IEEE802.11 standards, WiMAX etc.)  
- wireless wide area networks based on TDMA technology (GSM basics and protocols, GPRS)  
- data communication in wireless wide area networks (UMTS, HSPA, LTE, LTE-A etc.)  
- service architectures for mobile networks (including Android programming and WebRTC architectures)

The content of the lectures is illustrated by exercises and laboratories covering important aspects of the protocol stacks in mobile networks. The independent
processing of tasks, the qualified presentation and critical discussion of the outcomes by teams of students is part of the course. It improves the technical understanding and provides means to work as project leader in industry on those topics.

The course can be supplemented by the module Foundations of Internet Communication (KTR-GiK-M) with its instructive tasks executed in the router laboratory, by master seminars and projects or a master's thesis on related topics in next generation networks.

The language of the course will be announced during the first lecture.

**Module KTR-Proj Project Communication Networks and Services**

*Projekt Kommunikationsnetze und -dienste*

(since WS17/18)

Person responsible for module: Prof. Dr. Udo Krieger

**Contents:**

Important skills regarding the planning, development and implementation of new communication technologies, their advanced services, and the related protocols in next generation networks can only be learnt by team oriented development projects subject to stringent time and resource constraints, and clear development objectives, similar to an industrial project environment. Following these lines, the course will provide fundamental insights on the functionality of modern service architectures and communication principles of next generation Internet and its development.

After a short training phase and based on an autonomous working mode, students will learn by a teamwork project to solve advanced communication tasks and to implement new communication services associated with current research issues of the professorship. The basic network equipment, network operating systems, software and development tools will be provided in the laboratory. Handling hardware and software will be learnt by the students independently as part of the project after a guidance phase. All development steps and results will be documented by a corresponding written report and oral presentations of the results.

Actual topics will be announced on the web page of the module. The related specification of the development tasks and their milestones will be done in cooperation with the supervisor.

**Learning outcomes:**

The students are encouraged to a scientific working mode after a short guidance phase. They learn how to plan, develop and implement multimedia services and communication protocols in existing and future generation networks. They are trained to efficiently implement the applied protocols and to analyze the performance of the communication algorithms in a systematic manner. Students are instructed to investigate their developed protocol code elements by measurements and other tools, to evaluate their performance, and to develop improved protocol units. The processing of design, programming, and performance assessment tasks by teams of students and the effective arrangement of the group work is part of the training. It is the objective to gain practical experience on QoS-based multimedia communication and to develop the skills to implement and evaluate network components of modern service architectures.

The project follows scientific standards and deals with research issues of the professorship. The overall objective is to develop skills and knowledge required for a successful career in industry or research in the field of communication engineering.

**Remark:**

The module can be selected by exchange students and master students speaking only English.

**prerequisites for the module:**

none

**Recommended prior knowledge:**

- good programming skills in JAVA (or C++)

**Admission requirements:**
Module KTR-Proj

- good knowledge in data communication, similar to module KTR-Datkomm-B

Module Units

Projekt Kommunikationsnetze und-dienste

Mode of Delivery:
Lecturers: Prof. Dr. Udo Krieger
Language: English/German
Frequency: every winter semester

Learning outcome:
The details are sketched previously in the module description.

Contents:
Important skills regarding the planning, development and implementation of new communication technologies, their advanced services, and the related protocols of communication networks can only be learnt by team oriented development projects subject to stringent time and resource constraints, and clear development objectives, similar to an industrial project environment.

The students will get insight on the service and network architectures of next generation Internet. The main objective is the realization of development tasks applying accumulated knowledge on communication networks. After a short training phase and based on an autonomous working mode, students will learn by a teamwork project to solve advanced communication development tasks and to implement new communication services associated with current research issues of the professorship.

The organization of the project is following the framework of industry. It comprises definition, preparation, implementation and presentation phases. An incremental processing is performed like in industrial projects. It means
- a segmentation into specific work packages,
- its division into tasks and subtasks including milestones
- the presentation of intermediate results
- a final report with presentation and an individual colloquium to defend the outcome.

Research and development tasks are related to current research issues in "Future Generation Networks" and will be integrated into the module. An actual list of studied topics and related references are presented in the first lecture.

Literature:
A reference list will be provided in the first meeting of the project.

Examination
Coursework Assignment and Colloquium / Duration of Examination: 30 minutes
Duration of Coursework: 4 months
prerequisites for module examination:
### Regelmäßige Teilnahme an der Lehrveranstaltung

**Description:**
The results of teamwork and individual work phases which are reflected by the written project report and the associated presentations of the project results will be evaluated. The outcome must be completed within 4 months. The final assessment of the examination includes the corresponding chapters of the project report composed by the candidate and the evaluation of an individual colloquium of the candidate lasting 30 minutes.

All contributions must be achieved within the same semester. A regular participation in all units of the module is required to be admitted to the final examination.
### Module KTR-SSSProj-B KTR Bachelor Project Software Systems Science

**KTR Bachelorprojekt Software Systems Science**

<table>
<thead>
<tr>
<th>12 ECTS / 360 h</th>
<th>70 h Präsenzzeit</th>
</tr>
</thead>
<tbody>
<tr>
<td>290 h Selbststudium</td>
<td></td>
</tr>
</tbody>
</table>

(since WS18/19)

Person responsible for module: Prof. Dr. Udo Krieger

**Contents:**

Wichtige Fertigkeiten bei der Anwendung neuer Kommunikationstechnologien und zur Entwicklung neuer Kommunikationsdienste sind nur durch die Vermittlung praktischer Fähigkeiten und Erfahrungen in teamorientierten Prozessen unter Zeit- und Zielvorgaben industriennah erlernbar. Die Studierenden werden in der Lehrveranstaltung in einem angeleiteten, aber ansonsten eigenverantwortlich durchgeführten teamorientierten Arbeitsprozess aktuelle Entwicklungsaufgaben aus dem Forschungsbereich der Professur für Informatik bearbeiten.

**Learning outcomes:**

Die Lehrveranstaltung vermittelt Einblicke in die Entwicklung neuer Dienstarchitekturen und Netzentwicklungen aus dem Bereich des Internets der nächsten Generation.

Ziel ist der Erwerb praktischer Fertigkeiten auf dem Gebiet der IP-gestützten, qualitätsgesicherten Multimediakommunikation und die Fähigkeit, Lösungsvorschläge moderner Dienstarchitekturen im Internet der Zukunft sicher beurteilen zu können.

Studierende sollen ein vertieftes Verständnis der bei der Durchführung von Software-Projekten im Bereich Kommunikationsnetze und -dienste auftretenden konzeptionellen und praktischen Probleme wie auch von erfolgsversprechenden Lösungsansätzen dieser Probleme erhalten. Da dies anhand der intensiven Bearbeitung eines Themas aus dem Forschungsbereich der Professur für Informatik in Kleingruppen oder einzeln geschieht, gewinnen die Studierenden wichtige Erfahrungen in der Durchführung kleinerer, forschungsorientierter Projekte von der Grobkonzeption über die Detailplanung bis hin zur Umsetzung und Dokumentation der Ergebnisse in wissenschaftlich ausgerichteten Arbeitsberichten und in der professionellen Präsentation dieser Ergebnisse.

**Remark:**

Dieses Modul erstreckt sich über 2 Semester und umfasst 2x6=12 ECTS und 2x4=8 SWS.

Der Arbeitsaufwand beträgt insgesamt 360 Std., welche sich grob wie folgt gliedern:

- 30 Std. Recherche, Planung und Teilnahme am Planungswerkshop
- 40 Std. Teilnahme an Projektreffen, einschließlich Tutorien
- 180 Std. Durchführung des Projekts (Projektarbeit)
- 50 Std. Erstellung des Zwischenberichts (Hausarbeit)
- 60 Std. Erstellung des Abschlussberichts, Erstellung und Präsentation der Projektergebnisse (Hausarbeit und Kolloquium)

**prerequisites for the module:**

none

**Recommended prior knowledge:**

none

**Admission requirements:**
- good knowledge in Mathematics for Informatiker 2
- at least good JAVA (or C/C++) knowledge
- knowledge of data communication in the scope of KTR-Datkom-B or comparable knowledge is recommended
- fundamental methodological knowledge for planning and implementation of software projects, e.g. in the course "Software Engineering Lab" (SWT-SWL-B), is recommended.

Module Introduction to Parallel and Distributed Programming (DSG-PKS-B) - recommended
Module Data communication (KTR-Datkom-B) - recommended
Module Mathematics for Computer Science 2 (Linear Algebra) (KTR-Mfl-2) - recommended

**Frequency:** every semester  
**Recommended semester:** 4.  
**Minimal Duration of the Module:** 2 Semester

---

**Module Units**

**Bachelorprojekt Software Systems Science**

**Mode of Delivery:**

**Lecturers:** Prof. Dr. Udo Krieger

**Language:** German/English

**Frequency:** every semester

**Contents:**

The course provides insights into the development of new service architectures and network technologies from the field of the next generation of the Internet. The focus is on the independent, team-oriented practical implementation of a development task using the knowledge acquired in individual courses of the department of Informatics.

The operating system foundation and necessary software tools such as Vyatta-Routers, Wireshark, Atheris, and RapidStream are provided. Foundations of operation are developed by the students in the project itself.

The course extends over 2 consecutive semesters. The organisation of work takes place in an industrially oriented project framework from definition, preparation, implementation, and presentation phases. It should, as in real projects, be carried out incrementally, i.e.:

- subdivision of work into work packages (laboratories/work packages),
- their subdivision into tasks (tasks) and subtasks (subtasks) with milestones
- and the presentation of intermediate results in a report at the end of the 1st semester as well as
- an interim report with presentation of the work results in a seminar in the 2nd Semester.

Contents:
The seminar will discuss hot topics in the fields of stationary and mobile communication networks, new Internet services as well as fog and cloud computing architectures. The development of powerful transport and edge computing platforms for future generation software-defined networks supporting quality-of-service and mobility requirements will constitute the technical focus of the seminar.

The seminar offers a student the perspectives on the system-theoretical foundations of actual technical topics arising in the rapidly evolving areas of modern communication and fog/cloud computing systems. It is the objective of study to independently adopt the new technical methodologies stemming from the fields of software-defined communication networks, the theory of distributed systems, and the foundations of computer science.

Passing the examination of the seminar is, in general, a prerequisite to successfully write a master’s thesis at the Professorship of Computer Science or in cooperation with industrial peers.

The used language of the module will be announced during the first session of the seminar.

Literature:
The relevant reference list will be announced during the first session.

Examination
Coursework Assignment with presentation / Duration of Examination: 40 minutes
Duration of Coursework: 4 months

prerequisites for module examination:
Regelmäßige Teilnahme an der Lehrveranstaltung

Description:
The final grade evaluates the written report (this phase lasts at most 4 months) and the oral presentation as equally weighted components. Both the report and oral presentation have to achieved at least the grade 4.0 to pass the examination.

The language of the examination will be announced during the first session of the seminar.
Module MOBI-ADM-M Advanced Data Management

**Advanced Data Management**

6 ECTS / 180 h  
45 h Präsenzzeit  
135 h Selbststudium

(since SS21)  
Person responsible for module: Prof. Dr. Daniela Nicklas

**Contents:**  
With the rapid growth of the internet and more and more observable processes, many data sets became so large that they cannot be processed with traditional database methods any more. This modul covers advanced data management and integration techniques (also known under the term “big data”) that are useful when dealing with very large data sets.

**Learning outcomes:**
The students will understand the challenges of big data, and will be able to apply some of the new techniques to deal with it.

**Remark:**
The main language of instruction in this course is English. However, the lectures and/or tutorials may be delivered in German if all participating students are fluent in German.

The written reports/seminar essay and the presentation may be delivered in English or in German.

**prerequisites for the module:**
one

**Recommended prior knowledge:**
Foundations of relational databases, relational algebra and SQL; e.g. from Modul SEDA-DMS-B: Data management systems

**Admission requirements:**
one

**Frequency:**
every summer semester

The language of the course will be announced in the first lecture.

Examination  
Written examination / Duration of Examination: 75 minutes  
Description:  
Central written exam. The examination language is English.

The exam questions will be in English. The questions can be answered in English or German. The content that is relevant for the exam consists of the content presented in the lecture and in the practical assignments.

The exam consists of 7 tasks of which only 6 will be graded. The exam time includes a reading time of 15 minutes to select the tasks to be completed within the scope of the choices.

Participants who submit solutions for practical assignments can achieve bonus points. Details regarding the number of assignments, the number of bonus points per assignment, the conversion factor from bonus points to exam points (e.g., 10:1) and the type of assignments will be announced in the first practical assignment session.

If the points achieved in the exam are sufficient to pass the exam on its own (generally, this is the case when at least 50% of the points have been obtained), the converted bonus points will be added to the points achieved in the exam.

The grade 1.0 can be achieved without the bonus points.
**Module MOBI-DSC-M Data Streams and Complex Event Processing**

*Data Streams and Complex Event Processing*

(since WS20/21)

Person responsible for module: Prof. Dr. Daniela Nicklas

**Contents:**

The management of data streams and foundations of event processing: Applications, systems, query languages, continuous query processing, and security in distributed data stream management systems.

The module covers the following topics: Architectures of data stream management systems; Query languages; Data stream processing; Complex event processing; Security in data stream management systems; Application of data stream management systems

**Learning outcomes:**

Understand the challenges of data stream management and complex event processing

Recognize and link basic building blocks of data stream management tasks in different frameworks and systems

Develop and program queries on data streams and event streams in different query languages to process data streams and detect event patterns

Understand basic implementation techniques for data stream operators

Understand the main security challenges and solutions in data stream management systems

**Prerequisites for the module:**

None

**Recommended prior knowledge:**

Foundations of relational databases, relational algebra and SQL; e.g. from Modul MOBI-DBS-B: Database Systems

**Admission requirements:**

None

**Language:** English

**Frequency:** every winter semester

**Learning outcome:**

Understand the challenges of data stream management and complex event processing

Recognize and link basic building blocks of data stream management tasks in different frameworks and systems

Develop and program queries on data streams and event streams in different query languages to process data streams and detect event patterns

Understand basic implementation techniques for data stream operators

**ECTS / Total hours:**

6 ECTS / 180 h

45 h Präsenzzeit

135 h Selbststudium

**Weekly Contact Hours:**

2.00
Understand the main security challenges and solutions in data stream management systems

**Contents:**
The management of data streams and foundations of event processing: Applications, systems, query languages, continuous query processing, and security in distributed data stream management systems.

The module covers the following topics: Architectures of data stream management systems; Query languages; Data stream processing; Complex event processing; Security in data stream management systems; Application of data stream management systems

**Examination**
Oral examination / Duration of Examination: 15 minutes

**Description:**
oral or written exam (will be announced in class at the beginning of the semester).

The examination language is English.

Module MOBI-PRAI-B Bachelor Project Mobile Software Systems (AI)

Bachelor Project Mobile Software Systems (AI)

(since WS19/20)
Person responsible for module: Prof. Dr. Daniela Nicklas

Contents:
Applications of in mobile software systems, which are taken from current research activities in mobile, context-aware systems and data stream management, are carried out in part individually and in part in small teams of students, from conception, via theoretical and/or practical realization, to evaluation. In particular, the project concerns the development of sound concepts pertaining to the task to be addressed under the given project constraints. This requires studying the current research literature and relevant approaches on the project's topic.

An example of a project task would be the conceptual development, the prototypic implementation, and the case-study-driven evaluation of a small sensor-based, mobile system, which would require knowledge from the modul MOBI-DSC Data streams and event processing.

The tasks in the project will be tailored to Bachelor level.

Learning outcomes:
Studierende sollen ein vertieftes Verständnis der bei der Durchführung von praktischen, arbeitsteilig organisierten, Softwareprojekten auftretenden Probleme wie auch von erfolgversprechenden Lösungsansätzen zu diesen Problemen erhalten. Da dies anhand der intensiven Bearbeitung eines Themas aus dem Forschungsbereich der praktischen Informatik geschieht, gewinnen die TeilnehmerInnen wichtige Erfahrungen mit der Durchführung kleinerer, forschungsorientierter Projekte von der Grobkonzeption über die Detailplanung bis hin zur Umsetzung und Dokumentation der Ergebnisse in einem wissenschaftlich ausgerichteten Arbeitsbericht.

Remark:
The main language of instruction in this course is English. However, the lectures and/or tutorials may be delivered in German if all participating students are fluent in German.

The written reports/seminar essay and the presentation may be delivered in English or in German.

prerequisites for the module:
none

Recommended prior knowledge:
Programmierkenntnisse sowie grundlegende methodische Kenntnisse zur Planung und Durchführung von Softwareprojekten, z. B. erworben im Modul "Software Engineering Lab" (SWT-SWL-B), und zum wissenschaftlichen Arbeiten, z. B. erworben im Modul "Wissenschaftliches Arbeiten in der Informatik" (IAIWAI-B).

Admission requirements:
none

Frequency: every summer semester
Recommended semester: 1 Semester

Module PSI-AdvaSP-M Advanced Security and Privacy

Advanced Security and Privacy

6 ECTS / 180 h
45 h Präsenzzeit
135 h Selbststudium

(since WS20/21 to WS22/23)
Person responsible for module: Prof. Dr. Dominik Herrmann

Contents:
Information security and privacy are relevant in almost all information systems today. Many real-world use cases have complex security and privacy requirements involving multiple parties. Often there are multiple stakeholders with different, sometimes even contradictory interests. For instance, some use cases call for a solution that allows a service provider to process sensitive data without learning its content. In other cases it is not the content but some meta information such as location and usage intensity that has to be protected. And then there are scenarios where seemingly harmless pieces of data can be used to disclose or infer very personal pieces of information about an individual.

This module covers advanced techniques for information security and privacy that can be used to satisfy the complex requirements of practical systems. It builds upon the basic concepts in information security that are introduced in the module "Introduction to Security and Privacy" (PSI-IntroSP-B).

Learning outcomes:
This module is designed to bring students towards the research boundaries in the field of security and privacy technologies by covering a selection of contemporary topics in depth. The focus of the module is on technical safeguards that can be used by system designers and users to enforce properties such as confidentiality and integrity. Moreover, sophisticated attacks on security and privacy are explained.

Successful students will be able to explain attack strategies and defenses discussed in recent research papers. They will also be able to analyze whether a particular attack or defense is relevant in a specific scenario. Finally, they will be able to implement selected attacks and defenses with a programming language of their choice.

Remark:
This module is taught in English. It consists of a lecture and tutorials. During the course of the tutorials there will be theoretical and practical assignments (task sheets). Assignments and exam questions can be answered in English or German.

Lecture and tutorials are partially taught in form of a paper reading class. Participants are expected to read the provided literature in advance and participate in the discussions.

Workload breakdown:
- Lecture: 22.5 hours (2 hours per week)
- Tutorials: 22.5 hours (2 hours per week)
- Preparation and studying during the semester: 30 hours
- Assignments: 67.5 hours
- Preparation for the exam (including the exam itself): 37.5 hours

prerequisites for the module:
none

Recommended prior knowledge:
Participants should be familiar with basic concepts in information security and privacy, which can be acquired, for instance, by taking the module "Introduction to Security and Privacy" (PSI-IntroSP-B).

Admission requirements:
none
This includes basic knowledge about the commonly used security
terminology, common types of malware and attacks, buffer overflows
and related attacks, cryptography, network security, web security,
and concepts of privacy. Moreover, participants should have practical
experience with at least one scripting or programming language such
as Python or Java.

Module Web Technologies (MI-WebT-B) - recommended
Module Introduction to Security and Privacy (PSI-IntroSP-B) -

Module Units

1. Advanced Security and Privacy

**Mode of Delivery:** Lectures
**Language:** English/German
**Frequency:** every summer semester

**Learning outcome:**
cf. module description

**Contents:**
Selected topics:

- Cryptographic methods and protocols, e.g., homomorphic encryption,
  attribute-based credentials, secure multi-party computation, zero-knowledge
  proofs, format-preserving and identity-based encryption, group signatures,
  and proxy re-encryption.
- Attacks on privacy in datasets and communications (inference techniques,
  online tracking)
- Privacy engineering and privacy enhancing technologies (e.g., Tor)
- Usable security and privacy
- Other current topics in privacy and security

Some parts of the lecture are aligned with current events and recently published
research. The selected topics are therefore subject to change.

**Literature:**
Selected books:

- R. Anderson: Security Engineering
- A. Shostack: Threat Modelling
- J.-P. Aumasson: Serious Cryptography
- W. Stallings: Computer Security: Principles and Practice
- B. Schneier et al.: Cryptography Engineering
- J. Erickson: Hacking: The Art of Exploitation
- J. Katz & Y. Lindell: Introduction to Modern Cryptography
- L. Cranor & S. Garfinkel: Security and Usability

2. Tutorials for Advanced Security and Privacy

**Mode of Delivery:** Practicals

</tr>
</tbody>
</table>

**Examination**
Written examination / Duration of Examination: 90 minutes

**Description:**
The content that is relevant for the exam consists of the content presented in the lecture and tutorials (including the assignments) as well as the content of the discussed papers. The maximum number of points that can be achieved in the exam is 100.

Participants that solve all assignments correctly can collect up to 20 bonus points. Details regarding the number of assignments, the number of points per assignment, and the type of assignments will be announced in the first lecture. If the points achieved in the exam are sufficient to pass the exam on its own (generally, this is the case when at least 50 points have been obtained), the bonus points will be added to the points achieved in the exam. The grade 1.0 can be achieved without the bonus points.
Module PSI-EDS-B Ethics for the Digital Society

Ethics for the Digital Society

3 ECTS / 90 h

(since SS20)
Person responsible for module: Prof. Dr. Dominik Herrmann

Contents:
This module introduces students to fundamental concepts of ethics and their application to techniques that shape the digital society. It discusses the influence of current and upcoming technologies and their implications from an ethical perspective. The lecture is accompanied by a series of case studies, which focus on a concrete problem that is to be analyzed by the participants. Topics include decision making in autonomous systems and systems that employ so-called artificial intelligence, the reliability and dependability of computer systems, and privacy aspects of information systems.

Learning outcomes:
Participants will be able to reflect on their actions as a scientist as well as a computer professional. They learn how to evaluate the trade-offs that are inherent in new technologies and how to design information systems in ways that support the needs of a digital society. Successful participants will obtain the ability to apply ethical thinking to novel problems and potential solutions.

Remark:
The module is taught in English unless all participants are fluent in German. There may be a small number of guest lectures that is taught in German.

During the semester multiple case studies will be published. Participants will be asked to submit essays or solutions (small programs) discussing ethical aspects of those case studies. Essays will be peer-reviewed by other participants.

Module PSI-IntroSP-B Introduction to Security and Privacy
Introduction to Security and Privacy

6 ECTS / 180 h

(since WS20/21)
Person responsible for module: Prof. Dr. Dominik Herrmann

Contents:
This module introduces students to fundamental concepts in the fields of information security and the protection of privacy. It provides a broad overview over the most relevant topics from a technical perspective. The focus lies on practical issues that have to be considered when professional and personal information systems are built and operated.

Learning outcomes:
Successful students will know the mathematical background behind basic cryptographic primitives and be able to explain fundamental concepts of information security and privacy, including classical attacks and defenses. They will be able to apply their knowledge when implementing simple attack programs as well as building and operating defensive techniques.

Remark:
This module is taught in English. It consists of a lecture and tutorials. During the course of the tutorials there will be theoretical and practical assignments (task sheets). Assignments and exam questions can be answered in English or German.

Workload breakdown:
- Lecture: 22.5 hours (2 hours per week)
- Tutorials: 22.5 hours (2 hours per week)
- Preparation and studying during the semester: 30 hours
- Assignments: 67.5 hours
- Preparation for the exam (including the exam itself): 37.5 hours

prerequisites for the module:
none

Recommended prior knowledge:
It is strongly recommended to take this module only after successful completion of PSI-EIRBS-B, which lays the foundation for PSI-IntroSP-B, i.e., prospective PSI-IntroSP-B participants should be familiar with fundamentals of computer architecture (binary representation of strings and numbers in computers, bitwise operators (such as XOR), operation of a CPU, basics of assembly language), operating systems (memory layout and process management), and computer networks (basic IP routing and addressing, TCP/IP connection establishment). Finally, basic familiarity with the Linux command line is recommended.

Moreover, basic familiarity with common web technologies (HTTP, HTML, JavaScript) as well as relational database systems and SQL is a recommended prerequisite. Finally, participants should have working knowledge in at least one programming language (e.g., Python, C, or

Admission requirements:
none
Java) so that they can write small tools for automation purposes on demand.

**Module PSI-ProjectCAD-M Project Complex Attacks and Defenses**

*Project Complex Attacks and Defenses*

(151)

Person responsible for module: Prof. Dr. Dominik Herrmann

**Contents:**

Breaking into information systems is exciting, but impractical due to ethical and legal concerns. However, offensive competences and adversarial thinking are essential to build secure systems. In this project students will get the opportunity to acquire practical security skills in a dedicated training environment.

The goal of this project is to build and extend the "Insekta" platform. This web-based tool provides a frontend for virtual machines that can be used to study selected topics in security and privacy on one's own and at one's own pace.

This project is offered together with PSI-ProjectPAD, which focuses on conceptually simpler attacks and defenses.

The participants of the project familiarize themselves with security weaknesses in information systems and apply this knowledge to develop vulnerable services which others can use for training. To this end, participants form groups, read about attacks and defenses in textbooks and research papers, and discuss various options to implement them. Instructors will provide extensive and on-demand support to enable the participants to implement a vulnerable service that can be exploited to learn about a particular vulnerability.

Besides implementing vulnerable services, the participants prepare training materials, which consist of questions and tasks to test one's knowledge as well as step-by-step instructions. These training materials may also contain interactive elements for an improved learning experience.

The project also takes into account attacks on privacy, e.g., re-identifying individuals in anonymized datasets and communication networks, tracking users on the Internet, inferring sensitive attributes from seemingly harmless data traces, as well as mitigations, e.g., depersonalization strategies and differential privacy mechanisms. Here, practical activities consist in the preparation of datasets and scripts for analysis.

**Learning outcomes:**

Successful students will be able to describe attacks and defenses from textbooks and research papers in easily understandable form. They will also be able to carry out selected attacks in practice and implement defenses with a programming language of their choice.

**Remark:**

This project is taught in English, unless all participants are fluent in German. The workload of this project is equivalent to 270 hours.

**Workload breakdown:**

- 20 hrs: Getting familiar with the platform
- 50 hrs: Reading papers and researching security vulnerabilities
- 20 hrs: Preparing the talk (including time for attendance of other talks)
- 90 hrs: Implementing the vulnerable service and defenses
- 90 hrs: Writing training material and documentation

Note that there is another project (PSI-ProjectPAD) with a workload equivalent to 180 hours.
prerequisites for the module:
none

Recommended prior knowledge:
This project is primarily intended for students in master programs. Students in bachelor programs can participate, if they are qualified. Participants should be familiar with basic concepts in information security and privacy, which can be acquired, for instance, by taking the module "Introduction to Security and Privacy" (PSI-IntroSP-B). This includes basic knowledge about the commonly used security terminology, common types of malware and attacks, buffer overflows and related attacks, cryptography, network security, web security, and concepts of privacy.

Moreover, participants should have practical experience with at least one scripting or programming language such as Python or Java. Experience with Linux environments, web technologies, and network protocols is recommended.

Learning outcome:
cf. module description

Contents:
Potential topics include:

- web security (injection flaws and other issues mentioned in the OWASP Top 10)
- network security (such as DNS cache poisoning and rebinding attacks)
- security issues in C programs (buffer overflows, etc.)
- cryptography (low-level attacks on ciphers, high-level attacks on protocols, e.g., TLS)
- business logic failures
- misconfigurations
- attacks on availability (denial of service)
- attacks on privacy (such as inference, tracking, re-identification, fingerprinting)
- privacy defenses (such as k-anonymity, related concepts, differential privacy)

Literature:
Literature will be announced at the beginning of the project.
**Examination**

Coursework Assignment and Colloquium / Duration of Examination: 30 minutes  
Duration of Coursework: 3 months  

**prerequisites for module examination:**  
Regular attendance at project meetings.

**Description:**  
The module examination consists of two parts: Firstly, the participants submit a written report (in English) that includes the source code of the vulnerable service and the training material. Secondly, the participants give a talk in which they defend their work (in English; in German if all participants are fluent in German) by presenting theoretical and practical aspects of their vulnerable service as well as relevant mitigations. The maximum number of points that can be achieved in the module examination is 100.

Optionally, participants can submit intermediary results (in English) to collect up to 20 bonus points. If the module examination is passed on its own (generally, this is the case when at least 50 points are obtained), the bonus points will be added to the points achieved in the module examination. The grade 1.0 can be achieved without the bonus points. Details regarding the number of optional submissions during the semester, their type, the points per submission, and the respective deadlines will be announced in the first session of the project.
Module PSI-ProjectPAD

Module PSI-ProjectPAD Project Practical Attacks and Defenses  
Project Practical Attacks and Defenses  
6 ECTS / 180 h

(since SS18)  
Person responsible for module: Prof. Dr. Dominik Herrmann

Contents:  
Breaking into information systems is exciting, but impractical due to ethical and legal concerns. However, offensive competences and adversarial thinking are essential to build secure systems. In this project students will get the opportunity to acquire practical security skills in a dedicated training environment.

The goal of this project is to build and extend the "Insekta" platform. This web-based tool provides a frontend for virtual machines that can be used to study selected topics in security and privacy on one's own and at one's own pace.

This project is offered together with PSI-ProjectCAD-M, which focuses on conceptually more complex attacks and defenses.

The participants of the project familiarize themselves with security weaknesses in information systems and apply this knowledge to develop vulnerable services which others can use for training. To this end, participants form groups, read about attacks and defenses in textbooks and research papers, and discuss various options to implement them. Instructors will provide extensive and on-demand support to enable the participants to implement a vulnerable service that can be exploited to learn about a particular vulnerability.

Besides implementing vulnerable services, the participants prepare training materials, which consist of questions and tasks to test one's knowledge as well as step-by-step instructions. These training materials may also contain interactive elements for an improved learning experience.

The project also takes into account attacks on privacy, e.g., re-identifying individuals in anonymized datasets and communication networks, tracking users on the Internet, inferring sensitive attributes from seemingly harmless data traces, as well as mitigations, e.g., depersonalization strategies and differential privacy mechanisms. Here, practical activities consist in the preparation of datasets and scripts for analysis.

Learning outcomes:  
Successful students will be able to describe attacks and defenses from textbooks and research papers in easily understandable form. They will also be able to carry out selected attacks in practice and implement defenses with a programming language of their choice.

Remark:  
This project is taught in English, unless all participants are fluent in German. The workload of this project is equivalent to 180 hours.

Workload breakdown:

- 10 hrs: Getting familiar with the platform
- 30 hrs: Reading papers and researching security vulnerabilities
- 15 hrs: Preparing the talk (including time for attendance of other talks)
- 70 hrs: Implementing the vulnerable service and defenses
- 55 hrs: Writing training material and documentation

Note that there is another project (PSI-ProjectCAD-M) with a workload equivalent to 270 hours.
prerequisites for the module:
none

Recommended prior knowledge:
Students in bachelor and master programs can participate in this project.
Participants should be familiar with basic concepts in information security and privacy, which can be acquired, for instance, by taking the module "Introduction to Security and Privacy" (PSI-IntroSP-B). This includes basic knowledge about the commonly used security terminology, common types of malware and attacks, buffer overflows and related attacks, cryptography, network security, web security, and concepts of privacy.
Moreover, participants should have practical experience with at least one scripting or programming language such as Python or Java. Experience with Linux environments, web technologies, and network protocols is recommended.

Admission requirements:
none

Frequency: every semester  
Recommended semester:  
Minimal Duration of the Module: 1 Semester

Module Units

Project Practical Attacks and Defenses
Mode of Delivery: Practicals
Language: English/German
Frequency: every semester

Learning outcome:
cf. module description

Contents:
Potential topics include:
- web security (injection flaws and other issues mentioned in the OWASP Top 10)
- network security (such as DNS cache poisoning and rebinding attacks)
- security issues in C programs (buffer overflows, etc.)
- cryptography (low-level attacks on ciphers, high-level attacks on protocols, e.g., TLS)
- business logic failures
- misconfigurations
- attacks on availability (denial of service)
- attacks on privacy (such as inference, tracking, re-identification, fingerprinting)
- privacy defenses (such as k-anonymity, related concepts, differential privacy)

Literature:
Literature will be announced at the beginning of the project.
### Examination

Coursework Assignment and Colloquium / Duration of Examination: 30 minutes  
Duration of Coursework: 3 months  

**prerequisites for module examination:**  
Regular attendance at project meetings.

The grade 1.0 can be achieved without the bonus points. Details regarding the number of optional submissions during the semester, their type, the points per submission, and the respective deadlines will be announced in the first session of the project.
### Module PSI-ProjectSP-M Project Security and Privacy

**Project Security and Privacy**

<table>
<thead>
<tr>
<th>ECTS / h</th>
<th>6 ECTS / 180 h</th>
</tr>
</thead>
</table>

**Person responsible for module:** Prof. Dr. Dominik Herrmann

**Contents:**
In this project participants work independently on problems related to current research activities of the Privacy and Security in Information Systems Group. Instructors will provide guidance and supervision.

**Learning outcomes:**
Successful students will be able to independently work on research problems in security and privacy. They will also be able to implement tools and/or analyze data in order to answer a research question. Finally, they will be able to present their work in a talk and document their approach and results in a written report.

**Remark:**
This project is taught in English unless all participants are fluent in German. The workload of this project is equivalent to 270 hours.

**Workload breakdown:**
- 60 hrs: Getting familiar with the problem and preliminaries: reading related work, and understanding potentially existing source code
- 20 hrs: Preparing the talk (including time for attendance of other talks)
- 110 hrs: Implementing tools and/or analyzing data
- 80 hrs: Writing final report with approach and methods

**Prerequisites for the module:**
none

**Recommended prior knowledge:**
Participants should have advanced knowledge and practical skills in information security and privacy, which can be acquired, for instance, in the module PSI-IntroSP-B and a security-related seminar or project. Depending on the actual topic participants may be expected to be familiar with commonly used security terminology, common types of malware and attacks, buffer overflows and related attacks, cryptography, network security, web security, and concepts of privacy.

Moreover, participants should have practical experience with at least one scripting or programming language such as Python or Java. Alternatively, participants should have strong skills in empirical data collection and data analytics (statistics and/or machine learning).

Experience with Linux environments, web technologies, and network protocols is recommended.

**Admission requirements:**
none

**Frequency:** every semester

**Recommended semester:** 1 Semester

**Minimal Duration of the Module:** 1 Semester

Module PSI-ProjectSP-M

**Frequency:** every semester

**Learning outcome:**
cf. module description

**Contents:**
Potential topics include

- empirical studies, either manually (surveying security properties of systems) or automatically (e.g., web crawls),
- creating scanning tools and platforms where results can be published in a meaningful way (e.g., PrivacyScore.org),
- analyzing data sets for aspects of security and privacy, and
- implementing cryptographic or anonymization techniques in a secure fashion, e.g., for encrypted storage in cloud services.

**Literature:**
Literature will be announced at the beginning of the project.

**Examination**
Coursework Assignment and Colloquium / Duration of Examination: 30 minutes
Duration of Coursework: 3 months

**prerequisites for module examination:**
Regular attendance at project meetings.

**Description:**
The module examination consists of two parts: Firstly, the participants submit a written report (in English) that includes the source code, datasets, and analysis scripts. Secondly, the participants give a talk in which they defend their work (in English; in German if all participants are fluent in German) by presenting related work, their approach, and results. The maximum number of points that can be achieved in the module examination is 100.

Optionally, participants can submit intermediary results (in English) to collect up to 20 bonus points. If the module examination is passed on its own (generally, this is the case when at least 50 points are obtained), the bonus points will be added to the points achieved in the module examination. The grade 1.0 can be achieved without the bonus points. Details regarding the number of optional submissions during the semester, their type, the points per submission, and the respective deadlines will be announced in the first session of the project.
## Module PSI-SSSProject-B Software Systems Science Project: Security and Privacy

**Software Systems Science Project: Security and Privacy**

| 12 ECTS / 360 h |

(since WS18/19)

Person responsible for module: Prof. Dr. Dominik Herrmann

### Contents:

This project is specifically offered for Software Systems Science students. The participants of the project familiarize themselves with security and privacy issues that arise during the development of information systems.

Potential tasks during the project include the development of training scenarios for the Insekta platform, designing and/or participating in "build it – break it – fix it" challenges, and contributing to ongoing research activities of members of the Privacy and Security in Information Systems Group. Typically, participants work on their project in small groups. They carry out required research (mostly) on their own, reading about attacks and defenses in textbooks and research papers. Instructors will provide extensive and on-demand support to enable the participants.

Students who are interested in this project may approach a member of the PSI group in order to learn about currently available topics.

### Learning outcomes:

Successful students will be able to explain attacks and defenses from textbooks and research papers. They will also be able to carry out selected attacks in practice and implement defenses with a programming language of their choice.

### Remark:

This project is taught in English, unless all participants are fluent in German. The workload of this project is equivalent to 360 hours (spread over two semesters).

### Workload breakdown:

- 20 hrs: Getting familiar with the task, obtaining preliminary knowledge
- 60 hrs: Reading papers and researching security vulnerabilities
- 30 hrs: Preparing the talks (including time for attendance of other talks)
- 200 hrs: Implementation
- 50 hrs: Writing project report

Note that there are other projects (PSI-ProjectCAD-M, PSI-ProjectPAD, PSI-ProjectSP-M) with different workloads.

### Prerequisites for the module:

none

### Recommended prior knowledge:

Participants should be familiar with basic concepts in information security and privacy, which can be acquired, for instance, by taking the module “Introduction to Security and Privacy” (PSI-IntroSP-B). This includes basic knowledge about the commonly used security terminology, common types of malware and attacks, buffer overflows and related attacks, cryptography, network security, web security, and concepts of privacy.

### Admission requirements:

none
Moreover, participants should have practical experience with at least one scripting or programming language such as Python or Java. Experience with Linux environments, web technologies, and network protocols is recommended.

### Examination

Coursework Assignment / Duration of Coursework: 3 months

**prerequisites for module examination:** Regular attendance

**Description:**

The module examination consists of two module examination segments. The respective weights of the two module examination segments will be announced at the beginning of the semester in which the project starts.

The first segment of the module examination consists of a written report (in English) that includes any source code, datasets, and analysis scripts. The maximum number of points that can be achieved in this part of the module examination is 100.

Optionally, participants can submit intermediary results (in English) to collect up to 20 bonus points. If this part of the module examination is passed on its own (generally, this is the case when at least 50 points are obtained), the bonus points will be added to the points achieved in this part of the module examination. The grade 1.0 can be achieved without the bonus points. Details regarding the number of optional submissions during the semester, their type, the points per submission, and the respective deadlines will be announced in the first session of the project.

Coursework Assignment and Colloquium / Duration of Examination: 30 minutes

**Duration of Coursework:** 3 months

**prerequisites for module examination:**
Regular attendance

Description:
The module examination consists of two module examination segments. The respective weights of the two module examination segments will be announced at the beginning of the semester in which the project starts.

The second segment of the module examination consists of two parts: Firstly, the participants submit a written report (in English) that includes any source code, datasets, and analysis scripts. Secondly, the participants give a talk in which they defend their work (in English; in German if all participants are fluent in German) by presenting related work, their approach, and results. The maximum number of points that can be achieved in the module examination is 100.

Optionally, participants can submit intermediary results (in English) to collect up to 20 bonus points. Module PSI-Sem-M Seminar Research Topics in Security and Privacy

3 ECTS / 90 h

(since SS20)
Person responsible for module: Prof. Dr. Dominik Herrmann

Contents:
This seminar provides in-depth coverage of advanced topics in one of the fields of information security and privacy.

Participants learn to review, analyze, and discuss scientific sources (books and essays). While participants are expected to perform the actual research independently and mostly on their own, the instructors provide extensive support throughout the seminar. The instructors will provide guidance on scientific methods, e.g., how to approach a topic, how to find relevant literature, how to read a paper efficiently, how to write a seminar report, and how to give a good talk.

Participants will be asked to deliver manageable chunks of work throughout the semester (such as summarizing literature in a survey, reviewing the work of others, writing a draft of the term paper, reviewing the draft of other students, etc.). They will receive feedback by their peers and by the instructors.

The actual topics are subject to change. A list of available topics is made available before the first session via UnivIS or VC.

Learning outcomes:
The participants learn to find, read, and summarize scientific texts. They also learn to assess statements and to discuss them critically. Finally, they learn to write scientific texts and to present their results in a talk.

Students who participate in the optional peer review process will also learn techniques to give useful feedback to others as well as how to accept feedback for one’s own work.

Remark:
The default language in this seminar is English, unless all participants are fluent in German.

prerequisites for the module:
none

Recommended prior knowledge:
Participants should have basic knowledge in software engineering, foundations of computing, operating systems, and networks.
Knowledge in information security and privacy (obtained, e.g., in PSI-IntroSP-B and by having completed a seminar or thesis in the field of information security) is strongly recommended.

Admission requirements:
none

Frequency: every winter semester
Recommended semester:

Minimal Duration of the Module:
1 Semester

Module Units
Seminar Research Topics in Security and Privacy
2,00 Weekly Contact Hours

Mode of Delivery: Seminar
Language: English/German
Frequency: every winter semester

Contents:

cf. module description

### Literature:
- Alley: The Craft of Scientific Writing
- Anderson: Security Engineering
- Pfleeger et al.: Security in Computing
- Stallings & Brown: Computer Security: Principles and Practice
- Strunk & White: The Elements of Style

Other relevant literature is presented in the first session.

### Examination

**Coursework Assignment with presentation / Duration of Examination:** 30 minutes  
**Duration of Coursework:** 3 months  

**prerequisites for module examination:**
Continuous attendance in the seminar sessions is mandatory, cf. §9 (10) APO.

**Description:**
The module examination consists of two parts, a term paper (in English) and a talk (in English; in German if all participants are fluent in German). The maximum number of points that can be achieved in the module examination is 100. Details regarding the number of points that can be achieved in the talk and in the report will be announced in the first session of the project.

Optionally, participants can submit intermediary results (in English) such as surveys, written reviews for the work of other participants, and a draft of the term paper. Participants can thereby earn 20 bonus points. If the module examination is passed on its own (generally, this is the case when at least 50 points are obtained), the bonus points will be added to the points achieved in the module examination. The grade 1.0 can be achieved without the bonus points.
## Module SME-Projekt-B Bachelor’s project on Smart Environments

*Bachelorprojekt zu Smart Environments*

(since WS18/19)

Person responsible for module: Prof. Dr. Diedrich Wolter

### Contents:
This module addresses applications of methods from the topic area Smart Environments in context of a software development project. To this end, a smart system will be develop to tackle a practical application problem, focusing on the software development. Among the methods used, artificial intelligence techniques play an important role.

### Learning outcomes:
- gain skills to identify relevant methods to solve a practical problem
- gain competence to apply a basic method to a practical problem
- gain experience with problems that can arise applying a basic method to a practical problem
- improve programming skills
- learn to evaluate utility of approaches with respect to practical problems
- learn to present results in a scientific paper and defend the work in a colloquium

### Remark:
The language of instruction in this course is German. However, all course materials are available in Englisch. Term papers and presentations may be delivered in either German or English.

### Prerequisites for the module:
none

### Recommended prior knowledge:
Basic skills in computer science, especially programming skills are highly recommended.

### Admission requirements:
none

### Frequency:
every semester

### Recommended semester:

### Minimal Duration of the Module:

Umsetzung der Projektaufgabe, Dokumentation in Form eines wissenschaftlichen Aufsatzes als Hausarbeit sowie Präsentation im Kolloquium.

Die Bekanntgabe der Prüfungssprache erfolgt in der ersten Sitzung der Lehrveranstaltung.
Module SME-Projekt-M master project on smart environments

Masterprojekt zu Smart Environments

(since WS17/18)
Person responsible for module: Prof. Dr. Diedrich Wolter

Contents:
This module addresses applications of advanced methods from the topic area Smart Environments. To this end, a smart system will be develop to tackle a practical application problem, focusing on the software development.

- research relevant literature
- develop own state-of-the-art approach
- system realization by implementation
- evaluation of system and its components
- presentation of results

Learning outcomes:
- gain skills to apply advanced methods from Smart Environments
- evaluate utility of approaches with respect to practical problems
- learn self-determined organisation of projects
- get acquainted with problems arising bridging theory and practice
- improve software development skills

Remark:
The main language in this course is English. Meetings may be held in German if all participating students are fluent in German. Presentations and term papers may be delivered in English or German.

prerequisites for the module:
none

Recommended prior knowledge:
Basic knowledge in computer science (especially programming skills) is highly recommended, knowledge in Artificial Intelligence (AI) or Smart Environments helpful.

Admission requirements:

Module SME-STE-M Introduction to Knowledge Representation: Space, Time, Events

Introduction to Knowledge Representation: Space, Time, Events

| 6 ECTS / 180 h |

(since WS21/22)
Person responsible for module: Prof. Dr. Diedrich Wolter

Contents:
This course gives an introduction to the area of knowledge representation, a sub-discipline of computer science in general and artificial intelligence in particular.

Knowledge representation is involved with identifying means to represent practical problems and according background knowledge as data structures, and to develop reasoning algorithms to solve these problems.

This course puts a spotlight on symbolic techniques to represent knowledge involving a spatio-temporal component as is typical for many practical real-world problems.

Contents:
- fundamental concepts: knowledge, abstractions, relations, logics
- syntax and semantics, formalization of knowledge
- representation and reasoning
- qualitative algebras and constraint calculi
- constraint-based reasoning
- spatial logics
- complexity and tractable subclasses

Learning outcomes:
- gain overview of formalisms for representing spatio-temporal logics
- gain skills to represent spatio-temporal knowledge symbolically
- gain overview of reasoning problems and learn to identify approaches for solving them
- learn to apply constraint-based reasoning methods
- learn to identify computational complexity of reasoning problems

Remark:
The main language of instruction in this course is English. Exams may be taken in either English or German. The lectures and tutorials may be delivered in German if all participating students are fluent in German.

prerequisites for the module:
none

Recommended prior knowledge:
Basic knowledge in computer science is recommended, for example obtained in a computer science bachelor's curriculum.

Admission requirements:
none

Frequency: every winter semester
Recommended semester: 1 Semester
Minimal Duration of the Module: 1 Semester

#### Examination

| Oral examination / Duration of Examination: | 20 minutes |

**Description:**
oral examination 20 minutes about lectures and practicals
**Module SME-Sem-B Bachelor seminar on Smart Environments**  
*Bachelorseminar zu Smart Environments*

(since WS20/21)  
Person responsible for module: Prof. Dr. Diedrich Wolter

**Contents:**  
Selected topics within the area of Smart Environments are covered. Topics in this area relate to application areas such as interactive systems as well as to computer science areas such as Artificial Intelligence.

**Learning outcomes:**  
Competences in scientific work will be acquired, in particular systematic literature research, structuring of complex topics, and (comparative) evaluation. Presentation skills to communicate specialized topics as well as scientific writing will be trained.

**Remark:**  
The main language of instruction in this course is German. Presentations and reports may also be delivered in English.

### Module SME-Sem-M master seminar on Smart Environments

**Masterseminar zu Smart Environments**

(since WS20/21 to SS21)

Person responsible for module: Prof. Dr. Diedrich Wolter

| Contents: | Selected topics within the area of Smart Environments are covered. Topics will relate to computer science areas such as Artificial Intelligence and knowledge representation. |
| Learning outcomes: | Competences in scientific work will be acquired, in particular systematic literature research, structuring of complex topics, and (comparative) evaluation of complex approaches. Presentation skills to communicate specialized topics as well as scientific writing will be trained. |
| Remark: | The main language of instruction in this course is English. However, the meetings may be held in German if all participating students are fluent in German. The written reports/seminar essay and the presentation may be delivered in English or in German. |
| prerequisites for the module: | none |
| **Recommended prior knowledge:** | basic knowledge in computer science (e.g., acquired in a Bachelor's curriculum) |

#### Examination

Coursework Assignment with presentation / Duration of Examination: 30 minutes

Duration of Coursework: 4 months

**Description:**
**Module SNA-ASN-M Social Network Analysis**  
*Analyse sozialer Netzwerke*  

<table>
<thead>
<tr>
<th>ECTS / hours</th>
<th>6 ECTS / 180 h</th>
</tr>
</thead>
</table>

(since WS17/18 to WS22/23)  
Person responsible for module: Prof. Dr. Kai Fischbach

**Contents:**  
Social network analysis focuses on relationships between or among social entities. This course presents an introduction to various concepts, methods, and applications of social network analysis. The primary focus of these methods is the analysis of relational data measured on populations of social actors.

**Learning outcomes:**  

**Remark:**  
The language of instruction in this course is German. However, the exam is available in English.

**prerequisites for the module:**  
none

**Recommended prior knowledge:**  
keine

**Admission requirements:**  
keine

**Frequency:**  
every winter semester

**Recommended semester:**  

**Minimal Duration of the Module:**  
1 Semester

### Module Units

1. **Analyse sozialer Netzwerke**

**Mode of Delivery:** Lectures  
**Lecturers:** Prof. Dr. Kai Fischbach  
**Language:** German  
**Frequency:** every winter semester

**Contents:**  
Topics include an introduction to graph theory and the use of directed graphs and matrices to study actor interrelations; structural and locational properties of actors, such as centrality, prestige, and prominence; subgroups and cliques; equivalence of actors, including structural equivalence and, blockmodels; local analyses, including dyadic and triad analysis; and introduction to statistical global analyses, using models such as $p^*$ and their relatives. Methods are illustrated on a wide range of social network examples using both standard social network analysis software and special purpose computer programs.

**Literature:**  

---

**2,00 Weekly Contact Hours**
2. Analyse sozialer Netzwerke

Mode of Delivery: Practicals

Lecturers: Scientific Staff Wirtschaftsinformatik, insb. Soziale Netzwerke

Language: German

Frequency: every winter semester

Literature:

2,00 Weekly Contact Hours

Examination

Written examination / Duration of Examination: 90 minutes

Description:
In der Klausur werden die in Vorlesung und Übung behandelten Inhalte geprüft. Es können 90 Punkte erzielt werden.

Durch die freiwillige Abgabe von semesterbegleitenden Studienleistungen können Punkte zur Notenverbesserung gesammelt werden, die auf die Klausur anrechenbar sind, sofern die Klausur auch ohne Punkte aus Studienleistungen bestanden ist. Zu Beginn der Lehrveranstaltung wird bekannt gegeben, ob Studienleistungen angeboten werden. Falls Studienleistungen angeboten werden, wird zu diesem Zeitpunkt auch die Anzahl, die Art, der Umfang und dieBearbeitungsdauer der Studienleistungen sowie die Anzahl an erreichbaren Punkten pro Studienleistung bekannt gegeben. Eine Bewertung von 1,0 kann auch ohne Punkte aus den Studienleistungen erreicht werden.
Module SNA-NET-M Network Theory

Netzwerktheorie

6 ECTS / 180 h

(since WS17/18 to WS22/23)
Person responsible for module: Prof. Dr. Kai Fischbach

Contents:
Individuals and technology shape and are shaped by organizations. Individuals and organizations are also affected by sets of interlinked networks linking people, technology, organizations, knowledge and resources. In this world of networks and organizations, how do coordination, communication, power, tasks, goals, and information interact to affect group and organizational behavior and the impact of information technology on this behavior? How do we conceptualize, measure, and evaluate organizations and networks? How do we evaluate the impact of policies and technology on these organizations and networks especially given the fact that organizations and networks are dynamic?

Learning outcomes:
Die Studierenden kennen interdisziplinäre Theoriebeiträge zur Erklärung der Struktur und Dynamik sozialer Netzwerke und können das erworbene Wissen auf relevante Forschungsfragen der Wirtschaftsinformatik anwenden. Sie verstehen den Einfluss der Struktur eines Netzwerkes auf seine internen Prozesse und die Veränderung der Struktur eines Netzwerkes im Zeitverlauf.

Themenfelder:
- Theorien sozialer und komplexer Netzwerke
- Emergenz und Dynamik sozialer Netzwerke
- Agentenbasierte Modellierung und Spieltheorie
- Informationsverarbeitung in sozialen Netzwerken
- Netzwerkprozesse
- Wissensnetzwerke

Remark:
The language of instruction in this course is German. However, the exam is available in English.

prerequisites for the module:

**Module SNA-OSN-M Project Online Social Networks**

_Projekt zu Online Social Networks_

<table>
<thead>
<tr>
<th>Credits</th>
<th>Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 ECTS</td>
<td>180 h</td>
</tr>
</tbody>
</table>

(since WS13/14 to WS22/23)

Person responsible for module: Prof. Dr. Kai Fischbach

further responsible: Zylka, Matthäus, Dipl.-Wirt.-Inf.

**Contents:**
This module is an introduction to the analysis of online social networks. The aim is twofold: to provide students with the tools necessary to undertake research into online networks, and to give an overview of the type of questions these data can answer.

**Learning outcomes:**
At the conclusion of the course, students should know not only how to calculate basic network metrics on pre-existing data sets, but also how to capture an online social network efficiently with the intent of answering a specific research question.

Further goals:
- Learn how the radical innovation process in small teams works
- Learn how to collaborate in multidisciplinary intercultural virtual teams
- Learn how to find trendsetter and trends on the Internet and social media
- Learn how to predict trends using SNA and statistical forecasting techniques

**Remark:**
The main language of instruction in this course is English. The written reports/seminar essay and the presentation have to be delivered in English.

**prerequisites for the module:**
none

**Recommended prior knowledge:**
We recommend attending at least one of the following courses:
- Social Network Analysis (SNA-ASN-M)
- Theories of Social Networks (SNA-NET-M)

**Admission requirements:**
keine

**Frequency:** every winter semester

**Recommended semester:**

**Minimal Duration of the Module:**
1 Semester

**Examination**

Coursework Assignment and Colloquium / Duration of Examination: 30 minutes

Duration of Coursework: 4 months

**prerequisites for module examination:**

Regelmäßige Teilnahme an der Lehrveranstaltung

**Description:**

Die Gewichtung der Prüfungsleistungen Hausarbeit und Kolloquium wird zu Beginn der Lehrveranstaltung von der Dozentin bzw. dem Dozenten bekannt gegeben.
## Module SNA-WIM-B Knowledge- and Information Management

### Wissens- und Informationsmanagement

| 6 ECTS / 180 h |

(since WS18/19 to WS22/23)

Person responsible for module: Prof. Dr. Kai Fischbach

### Contents:
Die Veranstaltung bietet eine Einführung in das betriebliche Wissens- und Informationsmanagement.

### Learning outcomes:
Ziel der Veranstaltung ist die Vermittlung folgender Kenntnisse und Fähigkeiten:

- Studierende kennen und verstehen relevante Begriffe, Modelle und Theorien des Wissens- und Informationsmanagements.
- Studierende können die Modelle und Theorien zur Analyse und Bewertung verschiedener Wissens- und Informationsmanagementsysteme anwenden.
- Studierende kennen verschiedene Wissens- und Informationsmanagementsysteme, die im inner- und überbetrieblichen Bereich zum Einsatz kommen.
- Studierende verstehen, wie Wissensmanagementsysteme geeignet gestaltet und genutzt werden können.
- Studierende verstehen die Bedeutung sozialer Netzwerke für das Wissensmanagement.

Module SWT-ASV-M

Applied Software Verification

6 ECTS / 180 h

(since WS19/20)
Person responsible for module: Prof. Dr. Gerald Lüttgen

Contents:
This module focuses on the increasingly important field of automated software verification, which aims at increasing the quality of today's complex computer systems. Students will be introduced to modern automated software verification and, in particular, to software model checking, and will be familiarised with a variety of important formal verification concepts, techniques and algorithms, as well as with state-of-the-art verification tools.

Learning outcomes:
On completion of this module, students will be able to thoroughly analyse software using modern software verification tools and understand the state-of-the-art techniques and algorithms that drive cutting-edge development environments offered by major software companies.

Remark:
The main language of instruction is English. The lectures and practicals may be delivered in German if all participating students are fluent in German.

The total workload of 180 hrs. is split approximately as follows:

- 30 hrs. attending lectures (Vorlesungen)
- 30 hrs. attending practicals (Übungen)
- 60 hrs. preparing and reviewing the lectures and practicals, including researching literature, studying material from additional sources and applying software tools
- 30 hrs. working on the assignment (Hausarbeit)
- 30 hrs. preparing for the colloquium (Kolloquium)

prerequisites for the module:
none

Recommended prior knowledge:
Basic knowledge in algorithms and data structures, mathematical logic and theoretical computer science. Knowledge of the module "Foundations of Software Analysis" (SWT-FSA-B) - or equivalent - is desirable.

Admission requirements:
none

Frequency: every summer semester

Minimal Duration of the Module:
1 Semester

Module Units

1. Applied Software Verification
Mode of Delivery: Lectures
Lecturers: Prof. Dr. Gerald Lüttgen
Language: English
Frequency: every summer semester

Contents:
The lectures (Vorlesungen) will address the following topics in automated software verification: (i) state machines, assertions and algorithms for state
space exploration; (ii) temporal logics for specifying program properties; (iii) model checking using binary decision diagrams; (iv) SAT-based bounded model checking; (v) software model checking based on decision procedures; (vi) abstraction-based software model checking. In addition, several state-of-the-art software verification tools will be introduced.

<table>
<thead>
<tr>
<th>Literature:</th>
</tr>
</thead>
</table>

2. Applied Software Verification

**Mode of Delivery:** Practicals

**Lecturers:** Scientific Staff Praktische Informatik, insbesondere Softwaretechnik und Programmiersprachen

**Language:** English

**Frequency:** every summer semester

**Contents:**
Students will practice the various theoretical and practical concepts taught in the lectures (Vorlesungen) by applying them to solve verification problems using several modern model-checking tools, and also by engaging in pen-and-paper exercises. Emphasis will be put on presenting and discussing the solutions to the exercises by and among the students, within the timetabled practicals (Übungen).

**Literature:**
- see the corresponding lectures -

**Examination**

Coursework Assignment and Colloquium / Duration of Examination: 20 minutes

Duration of Coursework: 3 weeks

**Description:**
Assignment (Hausarbeit) consisting of questions that practice, review and deepen the knowledge transferred in the lectures and practicals (Vorlesungen und Übungen). The assignment is set in English language, while answers may be provided in either English or German.

Colloquium (Kolloquium) consisting of questions testing the knowledge transferred in the lectures and practicals (Vorlesungen und Übungen), on the basis of the submitted solutions to the assignment (Hausarbeit). The colloquium can be held electively in English or German language.
### Module SWT-FPS-B Foundations of Program Semantics

*Foundations of Program Semantics*

(since WS22/23)

Person responsible for module: Prof. Dr. Gerald Lüttgen

| Contents: | This theory module offers students a mathematical perspective on sequential, imperative computer programs and concurrent, distributed software. It studies the formal semantics of programs which enables their analysis and verification. |
| Learning outcomes: | On completion of this module, students will be able to understand and apply core foundational concepts of, and techniques behind, program semantics and software, in the context of both sequential and concurrent systems. |
| Remark: | The main language of instruction is English. The lectures and practicals may be delivered in German if all participating students are fluent in German. The total workload of 180 hrs. is split approximately as follows: |
| 6 ECTS / 180 h | • 60 hrs. attending lectures (Vorlesungen)  
• 30 hrs. attending practicals (Übungen)  
• 60 hrs. preparing and reviewing the lectures and practicals, including researching literature, studying material from additional sources  
• 30 hrs. working on the assignment (Hausarbeit) and preparing for the colloquium (Kolloquium) |
| prerequisites for the module: | none |
| Recommended prior knowledge: | Basic knowledge in discrete mathematics, logics and algebra, such as acquired in the modules "Mathematik für Informatik 1 (Aussagen- und Prädikatenlogik)" (GdI-MfI-1) and "Mathematik für Informatik 2 (Lineare Algebra)" (KTR-MfI-2). |
| Admission requirements: | none |
| Frequency: every winter semester | Recommended semester: 1 Semester |
| Minimal Duration of the Module: | 1 Semester |

#### Module Units

| 1. Foundations of Software Analysis | 4,00 Weekly Contact Hours |
| Mode of Delivery: Lectures | |
| Lecturers: Prof. Dr. Gerald Lüttgen | |
| Language: English/German | |
| Frequency: every winter semester | |

| Contents: | Students will be introduced to the foundations of program semantics and their applications to program verification. Particular emphasis will be put on mathematical theories for reasoning about sequential and concurrent systems. The following topics will be covered: |
Part I: Mathematical Foundations
- Inductive definitions and proofs
- Orders, functions and fixed points
- Algebraic structures, equivalences and congruences
- Algebraic laws and logic systems

Part II: Sequential, Imperative Programs
- The imperative language IMP
- Natural, structural operational and denotational semantics
- The Hoare calculus

Part III: Concurrent, Distributed Software
- The process calculus CCS
- Strong and weak bisimulation
- Algebraic laws and axiomatization

Literature:

2. Foundations of Software Analysis
Mode of Delivery: Practicals
Lecturers: Scientific Staff Praktische Informatik, insbesondere Softwaretechnik und Programmiersprachen
Language: English/German
Frequency: every winter semester

Contents:
The practicals (Übungen) cover pen-and-paper exercises that will deepen the concepts and techniques taught in the lectures (Vorlesungen), and apply them to the analysis and verification of small examples of software. Emphasis will be put on presenting and discussing the solutions to the exercises by and among the students.

Literature:
- see the corresponding lectures -

Examination
Coursework Assignment and Colloquium / Duration of Examination: 20 minutes
Duration of Coursework: 3 weeks
Description:
Assignment (Hausarbeit) consisting of questions practicing, reviewing and deepening the knowledge transferred in the lectures and practicals (Vorlesungen und Übungen). The assignment is set in English; students may answer in either English or German.

Colloquium (Kolloquium) consisting of questions testing the knowledge transferred in the lectures and practicals (Vorlesungen und Übungen), on the basis of the submitted solutions to the assignment (Hausarbeit). The examination language is either English or German and may be chosen by the student at the colloquium.
### Module SWT-FSE-B Foundations of Software Engineering

**Foundations of Software Engineering**

(since WS19/20 to WS22/23)

Person responsible for module: Prof. Dr. Gerald Lüttgen

#### Contents:

This module teaches the foundations of software engineering that are applicable to various kinds of software systems – from information systems to embedded systems. It focusses on technologies, notations and processes for system specification, design, implementation, and verification and validation.

#### Learning outcomes:

Students will receive an introduction to the common problems and paradigms in, and foundations of, software development. They will also gather conceptional and practical knowledge in the analysis, design and testing of software, with an emphasis on technical aspects of specifying, designing, implementing, verifying and validating software.

#### Remark:

The main language of instruction is English. The lectures and practicals may be delivered in German if all participating students are fluent in German.

The total workload of 180 hrs. is split approximately as follows:

- 45 hrs. attending lectures (Vorlesungen)
- 30 hrs. reviewing the lectures, including researching and studying material from additional sources
- 45 hrs. attending practicals (Übungen)
- 30 hrs. preparing and reviewing the practicals, including researching and studying material from additional sources
- 30 hrs. preparing for the written exam (Klausur)

#### prerequisites for the module:

none

**Recommended prior knowledge:**

Basic knowledge in Computer Science, as well as knowledge in programming in Java and in algorithms and data structures.

**Admission requirements:**

none

**Minimal Duration of the Module:**

1 Semester

### Module Units

</tbody>
</table>

**Contents:**

The lectures (Vorlesungen) provide an introduction to the foundations of software engineering, including commonly used technologies, notations and processes for all software engineering phases. In particular, conceptual and technical aspects of software specification, architecture and design, and verification and validation.
are discussed, such as the Unified Modeling Language (UML) and its semantics, model-driven and pattern-based development, and software testing. Students are also introduced to specific aspects of agile software development.

**Literature:**

Further literature will be announced in the lectures.

### 2. Foundations of Software Engineering

**Mode of Delivery:** Practical

**Lecturers:** Prof. Dr. Gerald Lüttgen, Scientific Staff Praktische Informatik, insbesondere Softwaretechnik und Programmiersprachen

**Language:** English/German

**Frequency:** every summer semester

**Contents:**
The practicals (Übungen) exercise and deepen the conceptual knowledge transferred via the lectures (Vorlesungen), and relay practical knowledge in software engineering.

**Literature:**
- see the corresponding lectures -

### Examination

**Written examination / Duration of Examination:** 120 minutes

**Description:**
Written exam (Klausur) consisting of questions that relate to the contents of the lectures (Vorlesungen) and practicals (Übungen) of this module.

The written exam is set in English, while answers may be provided in either English or German. The exam is passed if at least 50% of the available points are reached.
Module SWT-PR1-M Masters Project in Software Engineering and Programming Languages
Masterprojekt Softwaretechnik und Programmiersprachen

6 ECTS / 180 h

(since WS19/20)
Person responsible for module: Prof. Dr. Gerald Lüttgen

Contents:
Attention: The module SWT-PR1-M cannot take place in winter semester 2019/20!

Topics in Software Engineering and Programming Languages are carried out individually or in teams of students, from conception, via theoretical and/or practical realization, to evaluation. In particular, the project concerns the development of sound concepts pertaining to the task to be addressed under the given project constraints. This requires studying academic literature and relevant technologies and approaches on the project's topic.

An example of a project task would be the conceptual development, the prototypic implementation, and the case-study-driven evaluation of tools for software verification, which requires the prior attendance of the module "Applied Software Verification" (SWT-ASV-M), or equivalent knowledge. Another example would be designing and implementing a compiler of a small programming language in either an imperative, object-oriented or functional language, which requires the prior attendance of the module "Principles of Compiler Construction" (SWT-PCC-M), or equivalent knowledge.

Learning outcomes:
Students will deepen their knowledge regarding the conceptual problems that arise when carrying out scientific projects related to Software Systems Science, and regarding approaches to possible solutions. Students will also gain important experience in carrying out such projects, from project planning, to the abstract and concrete design, to the realization, to the documentation of results in a scientific project report.

Remark:
The main language of instruction is English. The module may be delivered in German if all participating students are fluent in German. A regular participation in the project meetings is necessary.

The total workload of 180 hrs. is split approximately as follows:

- 10 hrs. participating in introductions to and tutorials on methods, software tools, and giving presentations on the project status
- 20 hrs. completing the exercises for bonus points
- 115 hrs. researching and familiarization with the project topic and conducting the project work
- 35 hrs. compiling a project report (Assignment/Hausarbeit) and preparation of the Colloquium (Kolloquium).

prerequisites for the module:
none

Recommended prior knowledge:
Basic knowledge in software engineering and programming languages, knowledge in the subject matter of the project topic.

Admission requirements:
none

Frequency: every semester
Recommended semester: 1 Semester

Minimal Duration of the Module:
1 Semester
## Module Units

**Masters Project in Software Engineering and Programming Languages**

**Mode of Delivery:** Practicals

**Lecturers:** Prof. Dr. Gerald Lüttgen, Scientific Staff Praktische Informatik, insbesondere Softwaretechnik und Programmiersprachen

**Language:** English/German

**Frequency:** every semester

**Learning outcome:**
To be announced at the beginning of the project.

**Contents:**
Conduct of the project, accompanied by tutorials and regular project meetings.

**Literature:**
To be announced at the beginning of the project.

---

**Examination**

**Coursework Assignment and Colloquium / Duration of Examination:** 20 minutes

**Duration of Coursework:** 12 weeks

**prerequisites for module examination:**
Regelmäßige Teilnahme an den zugehöriigen Lehrveranstaltungen

**Description:**
Production of a written report on the software project carried out (Assignment/Hausarbeit). The student may choose whether to write/compose the project report in English or German.

Discussion of this project report and of the developed artefacts in the context of the wider project topic (Colloquium/Kolloquium). The examination language is either English or German and may be chosen by the student at the colloquium.
Module SWT-RSD-B Reactive Systems Design

Reactive Systems Design

6 ECTS / 180 h

(since WS20/21)
Person responsible for module: Prof. Dr. Gerald Lüttgen

Contents:
Reactive systems are digital systems that continuously react to their environment by reading sensor values, computing output values and emitting those values to actuators. Such systems are designed using domain-specific languages, and must often satisfy stringent real-time requirements. They are embedded in many parts of our daily lives: whether it is a home automation system, a driver's assistance system in a modern car, or sophisticated medical equipment at the hospital, we depend on the reliability, correctness, and quality of these systems' software.

This module discusses the theoretical concepts and the engineering practice of the model-driven development of reactive systems software. The module's foci are on the synchronous programming paradigm, on automatic code generation from system models, on techniques for verifying and testing reactive systems, and on deploying and integrating reactive software components on a specific operating system and execution platform.

Learning outcomes:
On completion of this module, students will be able to understand the context and concepts of reactive systems design. They will be able to define domain-specific languages, to employ state-of-the-art techniques for the model-driven engineering of reactive software, and to apply methods for testing and verifying reactive systems. Moreover, they will appreciate the complexities surrounding the deployment and integration of reactive software components on a physical model railway platform, taking timing requirements into account.

Remark:
The main language of instruction is English.

The total workload of 180 hrs. is split approximately as follows:

- 30 hrs. attending lectures (Vorlesungen)
- 30 hrs. attending practicals (Übungen)
- 60 hrs. preparing and reviewing the lectures and practicals, including researching literature, studying material from additional sources
- 60 hrs. working on the assignment (Hausarbeit) and preparing for the colloquium (Kolloquium)

prerequisites for the module:
none

Recommended prior knowledge:
Basic knowledge in discrete mathematics and programming, e.g., acquired in the modules "Mathematik für Informatik 1 (Aussagen- und Prädikatenlogik)" (GdI-Mfl-1) and "Einführung in Algorithmen, Programmierung und Software" (DSG-EiAPS-B).

Admission requirements:
none

Frequency: every summer semester
Recommended semester: 4.

Minimal Duration of the Module: 1 Semester

<tr>
<td>Students are introduced to modern model-driven techniques, languages and tools for designing and programming reactive systems. The lectures first motivate reactive systems, present their basic design principles, examine the role of domain-specific languages, and study the synchronous programming paradigm. Then, techniques for verifying design properties via model checking, for automatically transforming design models into running code, and for automated testing are studied. The synchronous language and model-based development environment <strong>KIELER SCCharts</strong> is used for illustrating key semantic and engineering concepts. Several topics on the deployment and integration of reactive software components on a physical execution platform are also addressed: the timing analysis problem, the mapping of components to real-time tasks, and a practical approach to execute components together in a semantics-preserving manner using the synchronous programming language ForeC.</td>

| **Description:**
| The Assignment (Hausarbeit) consists of questions practicing, reviewing and deepening the knowledge transferred in the lectures and practicals (Vorlesungen und Übungen); questions may also involve the practical use of the development tools introduced in the practicals.
| The Colloquium (Kolloquium) consists of questions testing the knowledge transferred in the lectures and practicals (Vorlesungen und Übungen), on the basis of the submitted solutions to the assignment (Hausarbeit). |
Module SWT-SEM-B Seminar in Software Engineering and Programming Languages (Bachelor)

Seminar Software Engineering and Programming Languages (Bachelor)

3 ECTS / 90 h

(since WS17/18)
Person responsible for module: Prof. Dr. Gerald Lüttgen

Contents:
Current topics in software engineering and programming languages.

Learning outcomes:
Students will compile and acquire current topics in software engineering and programming languages by carrying out and documenting a guided literature survey, and by preparing and delivering a coherent, comprehensible presentation to their peers.

Remark:
The main language of instruction is English. The seminar may be delivered in German if all participating students are fluent in German. Regular participation in the presentations is required.

The total workload of 90 hrs. is split approximately as follows:

- 20 hrs. consultations and presentations (Referate), including discussions
- 25 hrs. literature research and familiarization and evaluation of literature
- 45 hrs. working on the assignment (Hausarbeit) and preparation for the presentation (Referat)

prerequisites for the module:
none

Recommended prior knowledge:
Basic knowledge in software engineering and in programming languages.

Admission requirements:
none

Recommended semester:

Minimal Duration of the Module:
1 Semester

Module Units

Software Engineering and Programming Languages (Bachelor)
Mode of Delivery: Seminar
Lecturers: Prof. Dr. Gerald Lüttgen, Scientific Staff Praktische Informatik, insbesondere Softwaretechnik und Programmiersprachen
Language: English/German
Frequency: every semester

Contents:
Various current topics in software engineering and programming languages, which complement and/or extend the technical and methodological aspects of the degree programme’s modules related to these fields.

Literature:
Literature will be allocated according to the topics to be discussed.

Examination
Coursework Assignment with presentation / Duration of Examination: 40 minutes
Duration of Coursework: 8 weeks

**prerequisites for module examination:**
Regular participation in the seminar.

**Description:**
Assignment (Hausarbeit) consisting of a written report on the topic assigned to the student.

Presentation (Referat) on the topic assigned to the student, including a discussion.
### Module SWT-SEM-M Seminar in Software Engineering and Programming Languages (Master)

**Seminar Software Engineering and Programming Languages (Master)**

3 ECTS / 90 h

(since WS17/18)

Person responsible for module: Prof. Dr. Gerald Lüttgen

**Contents:**
Current topics in software engineering and programming languages. This may comprise the full spectrum of research topics in these fields, from the analysis, comparison and evaluation of current software technologies and tools, to the discussion and evaluation of novel research proposals.

**Learning outcomes:**
Students will compile and acquire current topics in software engineering and programming languages by independently carrying out and documenting a literature survey, and by preparing and delivering a coherent, comprehensible presentation to their peers. Students will also be able to scientifically discuss topics in software engineering and programming languages with their peers.

**Remark:**
The main language of instruction is English. The seminar may be delivered in German if all participating students are fluent in German. Regular participation in the presentations is required.

The total workload of 90 hrs. is split approximately as follows:

- 20 hrs. consultations and presentations (Referate), including discussions
- 25 hrs. literature research and familiarization and evaluation of literature
- 45 hrs. working on the assignment (Hausarbeit) and preparation for the presentation (Referat)

**prerequisites for the module:**
none

**Recommended prior knowledge:**
Basic knowledge in software engineering, in programming languages and in the subject matter of the seminar. Additionally, basic knowledge of scientific methods is expected.

**Recommended semester:**

**Admission requirements:**
none

**Minimal Duration of the Module:**
1 Semester

### Module Units

**Software Engineering and Programming Languages (Master)**

**Mode of Delivery:** Seminar

**Lecturers:** Prof. Dr. Gerald Lüttgen, Scientific Staff Praktische Informatik, insbesondere Softwaretechnik und Programmiersprachen

**Language:** English/German

**Frequency:** every semester

**Contents:**
Various current topics in software engineering and programming languages, which complement and/or extend the technical and methodological aspects of the degree programme's modules related to these fields.

**Literature:**
Will be allocated according to the topics to be discussed.

**2,00 Weekly Contact Hours**
Examination
Coursework Assignment with presentation / Duration of Examination: 40 minutes
Duration of Coursework: 8 weeks

prerequisites for module examination:
Regular participation in the seminar.

Description:
Assignment (Hausarbeit) consisting of a written report on the topic assigned to the student.
Presentation (Referat) on the topic assigned to the student, including a discussion.
### Module SWT-SWL-B Software Engineering Lab

**Software Engineering Lab**

<table>
<thead>
<tr>
<th>ECTS</th>
<th>6</th>
<th>180 h</th>
</tr>
</thead>
</table>

(since WS21/22)

Person responsible for module: Prof. Dr. Gerald Lüttgen

**Contents:**

Small teams of students will conduct a software project, starting from a brief problem description. This involves the application of modern software engineering tools, skills in collaboration and team organisation, and knowledge of processes and techniques for producing software artefacts and associated documents.

**Learning outcomes:**

Students will develop a piece of medium-sized software in small teams, thereby acquiring practical expertise in software engineering and skills in working in a software development team. In addition, this module deepens the students' programming proficiency and their understanding of flexible software engineering processes and of software and process quality, and familiarises them with the deployment and use of modern software engineering tools.

**Remark:**

The main language of instruction is English. The practicals may be delivered in German if all participating students are fluent in German. A regular attendance of team meetings and active participation is required throughout.

The total workload of 180 hrs. is split approximately as follows:

- 20 hrs. attending meetings of the student's team with the lecturer (Dozent) on planning, coordination and feedback
- 10 hrs. attending the accompanying practicals/tutorials (Übungen/Tutorials) on software tools
- 130 hrs. conducting the team project
- 20 hrs. working on the assignment (Hausarbeit) and preparing for the colloquium (Kolloquium)

**prerequisites for the module:**

none

**Recommended prior knowledge:**

Basic knowledge in Computer Science and Software Engineering, as well as knowledge in Java programming and in programming in the small.

**Admission requirements:**

**Frequency:** every winter semester

**Recommended semester:**

**Minimal Duration of the Module:**

1 Semester

Each team will carry out a software project, regularly meet with their tutor (Dozent) in order to critically reflect on the team's work, and participate in tutorials that introduce the software engineering tools and some software engineering techniques to be used in this project.

**Literature:**

See the description of the module "Foundations of Software Engineering (SWT-FSE-B)" for further literature.

**Examination**

Coursework Assignment and Colloquium / Duration of Examination: 45 minutes
Duration of Coursework: 2 weeks

**prerequisites for module examination:**
Regular participation in the associated practicals, including the participation in programming tasks.

**Description:**
Assignment (Hausarbeit) involving the compilation of a written project report in English or German language by each team, which shall cover the following topics:

- A description of the team’s produced artefacts, plus the electronic submission of the artefacts themselves;
- A description, justification and critical reflection of the employed software engineering processes, methods and techniques in general and in each development phase;
- A description of the team’s organisation, the distribution of work and the contributions of each team member.

The submission deadline and the details of the required content and format of this report will be announced at the beginning of the semester.

Colloquium (Kolloquium) consisting of a critical discussion of the team’s produced software and project report with respect to the taken design decisions and possible alternatives, the quality of the produced artefacts and documentation, the project’s status and completeness, the conduct of testing, and the appropriateness of the employed techniques and processes. The colloquium takes place in the presence of the team as a whole, but each question will be addressed to a specific student so that marks can be individualised. The colloquium can be held electively in English or German language.

Because this module involves a team effort, the examination can only be resit in a winter semester.
Module SWT-SWQ-M 

Software Quality 

6 ECTS / 180 h

(since WS21/22)
Person responsible for module: Prof. Dr. Gerald Lüttgen

Contents:
Software quality is fundamental for a software product's reliable, safe and secure operation, for its maintainability and reusability, and for user and customer satisfaction. Engineering high-quality software products and managing their development involves the application of advanced techniques, methods and tools for software quality assurance. This module focuses, in particular, on model-based testing, software inspection, software measurement, and static analysis, which are indispensable in today's agile software engineering practice.

Learning outcomes:
On completion of this module, students will be familiar with important concepts and techniques of software quality and their role in modern software engineering. In particular, students will be able to apply state-of-the-art methods and tools for achieving and monitoring software quality, and devise strategies for software quality assurance in different product and organizational contexts.

Remark:
The language of instruction is English.

The total workload of 180 hrs. is split approximately as follows:

- 30 hrs. attending lectures (Vorlesungen)
- 30 hrs. attending practicals (Übungen)
- 90 hrs. preparing and reviewing lectures and practicals, researching literature and studying material from additional sources
- 30 hrs. preparing for the written exam (Klausur)

prerequisites for the module:
none

Recommended prior knowledge:
Basic knowledge in Software Engineering, such as gained, e.g., in the module "Foundations of Software Engineering" (SWT-FSE-B). In particular, good knowledge of the Unified Modeling Language (UML) is expected.

Admission requirements:
none

Frequency: every winter semester
Recommended semester:
Minimal Duration of the Module:

Module Units

1. Software Quality
Mode of Delivery: Lectures
Lecturers: Prof. Dr. Gerald Lüttgen, Alexander Kraas
Language: English
Frequency: every winter semester

Learning outcome:
– see the module's learning outcomes/competences (Lernziele/Kompetenzen) listed above –

2,00 Weekly Contact Hours
### Contents:
The following topics will be covered in this module:

- Software quality within agile software engineering
- Fundamental testing concepts and techniques
- Automated, model-based testing
- Inspections and reviews
- Software measurement
- Static analysis
- Software quality management

### Literature:

### 2. Software Quality

**Mode of Delivery:** Practicals

**Lecturers:** Scientific Staff Praktische Informatik, insbesondere Softwaretechnik und Programmiersprachen

**Language:** English

**Frequency:** every winter semester

**Learning outcome:**

– see the module’s learning outcomes/competences (Lernziele/Kompetenzen) listed above –

**Literature:**

– see the corresponding lectures –

### Examination

**Written examination / Duration of Examination:** 90 minutes

**Description:**

Written exam (Klausur) consisting of questions that relate to the contents of the lectures (Vorlesungen) and practicals (Übungen) of this module.

The exam is passed if at least 50% of the available points are reached.
### Module VIS-IVVA-M Advanced Information Visualization and Visual Analytics

**Advanced Information Visualization and Visual Analytics**

<table>
<thead>
<tr>
<th>6 ECTS / 180 h</th>
</tr>
</thead>
</table>

(since WS22/23 to SS23)

Person responsible for module: Prof. Dr. Fabian Beck

**Contents:**
The course discusses methods for interactive information visualization and systems for explorative visual analysis. Visualizations blend with algorithmic solutions and get adopted to domain-specific needs. Giving a research-oriented perspective, the design and evaluation of such methods is the focus of the course, as well as their practical and interdisciplinary application in various fields.

**Learning outcomes:**
The students recognize the possibilities and limitations of data visualization and are able to apply visualization methods to concrete application examples. They understand the foundations of visual perception and cognition as well as their implications for the visual representation of data. They have a sound overview of possibilities for the visual representation of abstract data and are able to adapt visualization techniques to new problems and justify design decisions. On a conceptual level, they are able to integrate visualization techniques with interaction techniques and algorithmic solutions and design visual analytics solutions. They can evaluate visualization techniques in quantitative and qualitative user studies.

**Remark:**
The workload for this module typically is as follows:

- Lecture and exercise sessions: 45h
- Preparation and review of the lecture: 30h
- Work on exercises and assignments: 75h
- Preparation for the exam: 30h

**prerequisites for the module:**
none

**Recommended prior knowledge:**
Basic knowledge in information visualization and programming; knowledge in algorithms and data structures, human-computer-interaction, and machine learning and data science can be beneficial.

**Admission requirements:**
none

**Frequency:** every winter semester

**Recommended semester:**

**Minimal Duration of the Module:**
1 Semester

**Examination**

Written examination / Duration of Examination: 180 minutes

**Description:**

By voluntarily handing in graded assignments (semesterbegleitende Studienleistungen) during the semester, points can be collected to improve the grade, which can be credited to the exam, provided that the exam is also passed without points from assignments. At the beginning of the course, it will be announced whether graded assignments are offered. If offered, the number, type, scope and processing time of the assignments as well as the number of achievable points per assignment and in the module examination will also be announced at this time. A grade of 1.0 can also be achieved without points from the assignments.
Module VIS-Proj-M Master Project Information Visualization
Masterprojekt Informationsvisualisierung

6 ECTS / 180 h

(since SS22)
Person responsible for module: Prof. Dr. Fabian Beck

Contents:
In the project, students explore and apply different state-of-the-art approaches of applied computer science as a practical exercise. For a given scenario, an advanced interactive visualization application is to be developed in a group effort.

Learning outcomes:
Students learn to work independently on a research-oriented problem and to coordinate this with group members. They design an interactive application that meets the requirements of a given scenario, while understanding the possibilities offered by visual and algorithmic methods. They implement a software system as a team, recognize the challenges of such collaboration, and jointly find solutions.

Remark:
The workload for this module typically is as follows:
- Sessions and group meetings: 45h
- Background research and reading: 15h
- Implementation: 90h
- Documentation and presentation: 30h

prerequisites for the module:
none

Recommended prior knowledge:
Advanced programming skills; basic knowledge in visualization, human-computer-interaction, or machine learning and data science can be beneficial.

Admission requirements:
none

Frequency: 1
Recommended semester:
Minimal Duration of the Module:
1 Semester

Module Units
Masterprojekt Informationsvisualisierung
Mode of Delivery: Practicals

Examination
Coursework Assignment and Colloquium / Duration of Coursework: 4 months

4,00 Weekly Contact Hours
**prerequisites for module examination:**
Regular participation in the course

**Description:**
The language of the course and exam will be announced in the first session of the course.
### Module VIS-Sem-M Master Seminar Information Visualization

*Masterseminar Informationsvisualisierung*

<table>
<thead>
<tr>
<th>3 ECTS / 90 h</th>
</tr>
</thead>
</table>

(since SS22)

Person responsible for module: Prof. Dr. Fabian Beck

#### Contents:

The seminar investigates current trends in a subarea of visualization research. Based on an extensive literature review, different visualization approaches will be compared and evaluated. All participants work on individually assigned topics that contribute different facets to an overarching seminar topic.

#### Learning outcomes:

Students learn to independently research and find the latest research results regarding a given research topic in applied computer science. They discuss and evaluate state-of-the-art research results and develop a deep understanding of the individual topic, its potential use and application as well as limitations. They practice methods of scientific communication in oral and written form.

#### Remark:

The workload for this module typically is as follows:

- Sessions: 20h
- Literature search and reading: 25h
- Preparation of presentation: 15h
- Report writing: 30h

#### prerequisites for the module:

none

**Recommended prior knowledge:**

None required, but basic knowledge in visualization, human-computer-interaction, or machine learning and data science can be beneficial.

**Admission requirements:**

none

**Frequency:** every semester

Module xAI-DL-M Deep Learning

**Contents:**
Deep Learning is a form of machine learning that learns hierarchical concepts and representations directly from data. Enabled by continuously growing dataset sizes, compute power and rapidly evolving open-source frameworks Deep Learning based AI systems continue to set the state of the art in many applications and industries. The course will provide an introduction to the most relevant techniques in the field of Deep Learning and a broad range of its applications.

**Learning outcomes:**
In this course students will learn/recap some fundamentals from mathematics and machine learning that are critical for the introduction of the concept of Deep Learning. Participants will learn about various foundational technical aspects including optimization and regularization strategies, cost functions and important network architectures such as Convolutional Networks. Students will further get an insight into more advanced concepts such as sequence modelling and generative modelling. Participants will further learn about representative architectures of important algorithm categories, e.g., classification, detection, segmentation, some of their concrete use cases and how to evaluate them.

The lecture is accompanied by exercises and assignments that will help participants develop practical, hands-on experience. In those exercises students will learn how to implement and evaluate Deep Learning algorithms using Python and its respective commonly used libraries.

**Remark:**
The lecture is conducted in English. The workload of this module is expected to be roughly as follows:
- Lecture: 22.5h (equals the 2 SWS)
- Preparation of lectures and analysis of further sources: 30h (over the 15 weeks term)
- Exercise classes accompanying lecture: 22.5h (equals the 2 SWS)
- Work on the actual assignments: 75h (over the 15 weeks term)
- Preparation for exam: 30h

**prerequisites for the module:**
none

**Recommended prior knowledge:**
Strongly recommended: Good working knowledge of programming (in particular Python), Mathematics for Machine Learning [xAI-MML-M]
Further recommended: Bachelorproject Erklärbares Maschinelles Lernen [xAI-Proj-B], Lernende Systeme / Machine Learning [KogSys-ML-B], Einführung in die Künstliche Intelligenz / Introduction to AI [AI-KI-B], Mathematik für Informatik 2 (Lineare Algebra) [KTR-MfI-2], Algorithmen und Datenstrukturen [AI-AuD-B]

## Module Units

### 1. Deep Learning

**Mode of Delivery:** Lectures  
**Lecturers:** Prof. Dr. Christian Ledig  
**Language:** English/German  
**Frequency:** every winter semester  

**Learning outcome:**  
c.f. module description  

**Contents:**  
The lecture will be held in English. The following is a selection of topics that will be addressed in the course:  
- Relevant concepts in linear algebra, probability and information theory  
- Deep feedforward networks  
- Convolutional Neural Networks  
- Regularization, Batch Normalization  
- Optimization (Backpropagation, Stochastic Gradient Decent) and Cost Functions  
- Classification (binary, multiclass, multilabel)  
- Object Detection & Segmentation  
- Generative Modelling  
- Attention mechanisms & Transformer Networks  
- Evaluation of ML approaches  

**Literature:**  
- Zhang, Lipton, et al.: Dive into Deep Learning (https://d2l.ai/)  

Further literature will be announced at the beginning of the course.

### 2. Deep Learning

**Mode of Delivery:** Practicals  
**Lecturers:** N.N.  
**Language:** English/German  
**Frequency:** every winter semester  

**Learning outcome:**  
see module description  

**Contents:**  
Further exploration of concepts discussed in the lecture, often accompanied by assignments and programming exercises implemented in Python and the corresponding machine/deep learning libraries.  

**Literature:**  
see lecture description  

---

### Examination

Written examination / Duration of Examination: 90 minutes  

**Description:**
The content that is relevant for the exam consists of the content presented in the lecture and exercises/tutorials (including the assignments) as well as additional content of the discussed literature, which will be highlighted.

Participants can collect bonus points by working on and solving the assignments discussed during the exercises/tutorials. Details regarding the number of assignments, the number of points per assignment, and the type of assignments will be announced in the lecture.

If the points achieved in the exam are sufficient to pass the exam on its own, the bonus points (at most 20% of the maximum achievable points in the exam) will be added to the points achieved in the exam. The grade 1.0 can be achieved without the bonus points.
Module xAI-MML-M Mathematics for Machine Learning

Contents:
The course aims to establish a common mathematical foundation for the further study of advanced machine learning techniques. The content is selected specifically to be most relevant for students interested in machine learning problems and covers a broad range of concepts from, e.g., linear algebra, vector calculus, probability theory, statistics, and optimization.

Learning outcomes:
In this course students will learn fundamental mathematical concepts that are important prerequisites for the deeper understanding of the field of machine learning. The overarching goal of this course is to build a mathematical foundation by selectively covering the most essential mathematical concepts form a broad range of mathematical disciplines. Dependent on previous background, students will get the chance to learn critical ML-relevant mathematics for the first time or consolidate concepts that have been partially covered in their previous curriculum.

The lecture is accompanied by exercises and assignments that will help participants develop both theoretical and practical experience. In those exercises students will get the opportunity to learn how to apply and prove theoretical concepts as well as implement some concrete algorithms in Python and its respective commonly used libraries.

Remark:
The lecture is conducted in English. The workload of this module is expected to be roughly as follows:

- Lecture: 22.5h (equals the 2 SWS)
- Preparation of lectures and analysis of further sources: 30h (over the 15 weeks term)
- Exercise classes accompanying lecture: 22.5h (equals the 2 SWS)
- Work on the actual assignments: 75h (over the 15 weeks term)
- Preparation for exam: 30h

prerequisites for the module:
none

Recommended prior knowledge:
No specific prior knowledge is required, but the following will be helpful.

- Working knowledge of programming (e.g., in Python).
- Completion of mathematical courses addressing concepts of linear algebra (e.g., KTR-MfI-2), calculus (e.g., WIMa-B-002), or statistics (e.g., Stat-B).

Admission requirements:
none

Minimal Duration of the Module:
1 Semester

Module Units

1. Mathematics for Machine Learning

Mode of Delivery: Lectures
Lecturers: Prof. Dr. Christian Ledig

2,00 Weekly Contact Hours
**Language:** English/German  
**Frequency:** every summer semester  
**Learning outcome:**  
c.f. module description  

**Contents:**  
The lecture will be held in English. The following is a selection of topics that will be addressed in the course:

- Linear Algebra (e.g., vector spaces, span, basis, rank)
- Analytic Geometry (e.g., norms, inner product, projections)
- Matrix decompositions (e.g., Eigenvectors, SVD)
- Vector calculus (e.g., derivatives, Taylor series)
- Information Theory (e.g., entropy, KL divergence)
- Probability theory and distributions
- Statistics (e.g., estimators, tests)
- Optimization (e.g., gradient based)
- Machine Learning Problems (e.g., Density estimation, Dimensionality Reduction)

**Literature:**  

Further literature will be announced at the beginning of the course.

---

2. **Mathematics for Machine Learning**

**Mode of Delivery:** Practicals  
**Lecturers:** N.N.  
**Language:** English/German  
**Frequency:** every summer semester  
**Learning outcome:**  
see module description  

**Contents:**  
Further exploration of concepts discussed in the lecture by specific assignments and some programming exercises implemented predominantly in Python.

**Literature:**  
see lecture description

---

**Examination**

Written examination / Duration of Examination: 90 minutes  

**Description:**  
The content that is relevant for the exam consists of the content presented in the lecture and exercises/tutorials (including the assignments) as well as additional content of the discussed literature, which will be highlighted.

Participants can collect bonus points by working on and solving the assignments discussed during the exercises/tutorials. Details regarding the number of
assignments, the number of points per assignment, and the type of assignments will be announced in the lecture.

If the points achieved in the exam are sufficient to pass the exam on its own, the bonus points (at most 20% of the maximum achievable points in the exam) will be added to the points achieved in the exam. The grade 1.0 can be achieved without the bonus points.
Module xAI-Proj-B Bachelor Project Explainable Machine Learning  
*Bachelorprojekt Erklärbares Maschinelles Lernen*

(since WS22/23)  
Person responsible for module: Prof. Dr. Christian Ledig

Contents:  
The course provides to students the opportunity to work in small groups (ca. 2-3) in a hands-on fashion on selected state-of-the-art methodologies that are critical when bringing robust algorithms into practice. The project builds on and adds practical experience to the knowledge from corresponding lectures and exercises in the area of machine learning.

Learning outcomes:  
Students will familiarize themselves with a specific aspect of robust, explainable machine learning systems. Participants will learn to tackle a research-oriented question or problem independently, with little guidance. This will often involve the critical tasks: literature review, preparation and examination of datasets, implementation and comparison of prototypes, quantitative and qualitative evaluation of approaches. Within small groups, participants will learn to coordinate their project in a team and get comfortable with best practices of software development (e.g., testing, VCS). Documentation and presentation of the project will help to develop both oral (presentation) and written (technical project report) communication skills in a scientific environment. In comparison to the Bachelor Project this Master Project is more ambitious in terms of complexity of selected topics as well as expectations with respect to deliverables and presentations.

Remark:  
The workload of this module is expected to be roughly as follows:  
- Attendance of project meetings / presentation: 35h  
- Literature review and familiarization with topic (individual and within the team): 20h  
- Implementation of selected algorithm / methodology: 70h  
- Preparation of presentation: 15h  
- Written documentation and report: 40h

prerequisites for the module:  
none

Recommended prior knowledge:  
Recommended completion of modules "Lernende System / Machine Learning" or "Einführung in die KI / Introduction into AI.

Admission requirements:  
none

Frequency: every summer semester  
Recommended semester:  
Minimal Duration of the Module:  
1 Semester

Module Units

Bachelorprojekt Erklärbares Maschinelles Lernen  
Lecturers: Prof. Dr. Christian Ledig, N.N.  
Language: English/German  
Frequency: every summer semester

Module xAI-Proj-M Master Project Explainable Machine Learning
Masterprojekt Erklärbares Maschinelles Lernen

(since WS22/23)
Person responsible for module: Prof. Dr. Christian Ledig

Contents:
The course provides to students the opportunity to work in small groups (ca. 2-3) in a hands-on fashion on selected state-of-the-art methodologies that are critical when bringing robust algorithms into practice. The project builds on and adds practical experience to the knowledge from corresponding lectures and exercises in the area of machine learning.

Learning outcomes:
Students will familiarize themselves with a specific aspect of robust, explainable machine learning systems. Participants will learn to tackle a research-oriented question or problem independently, with little guidance. This will often involve the critical tasks: literature review, preparation and examination of datasets, implementation and comparison of prototypes, quantitative and qualitative evaluation of approaches. Within small groups, participants will learn to coordinate their project in a team and get comfortable with best practices of software development (e.g., testing, VCS). Documentation and presentation of the project will help to develop both oral (presentation) and written (technical project report) communication skills in a scientific environment. In comparison to the Bachelor Project this Master Project is more ambitious in terms of complexity of selected topics as well as expectations with respect to deliverables and presentations.

Remark:
The workload of this module is expected to be roughly as follows:
• Attendance of project meetings / presentation: 35h
• Literature review and familiarization with topic (individual and within the team): 20h
• Implementation of selected algorithm / methodology: 70h
• Preparation of presentation: 15h
• Written documentation and report: 40h

prerequisites for the module:
none

Recommended prior knowledge:
Recommended completion of modules "Lernende System / Machine Learning", "Einführung in die KI / Introduction into AI" and "Deep Learning".

Admission requirements:
none

Frequency: every winter semester
Recommended semester: 1 Semester

Minimal Duration of the Module:
1 Semester

4,00 Weekly Contact Hours
