#### University of Bamberg

## Migration and Labor Market STATA I: Introduction to the Basics

Bamberg, May, 25, 2020

Dr. Ehsan Vallizadeh

Department of Economics – Integration of European Labor Markets

### Content

- 1. What do we have to do for the paper
- 2. Brief introduction into the datasets
- 3. Introduction into STATA
  - STATA Software Package
  - STATA Basics: three files
  - Getting started
  - The STATA Menus
  - The Grammar of STATA
  - Working with Do-Files
  - Organizing your session
  - Processing your data
  - Describe your data
  - Making graphs

### What do we have to do for the paper?

- 1) State of research (brief literature review)
- 2) Defining the question
  - Wage effects of immigration
  - Employment effects
- 3) Preparing the dataset
  - Generating Dummy Variables
  - Generating/Transforming other Variables
- 4) Describing the data
  - Data sources
  - Descriptive statistics
  - Graphs
- 5) Running simple regression models
- 6) Presentation in class and drafting the paper

University of Bamberg

$$y_{ijt} = \theta p_{ijt} + s_i + x_j + \pi_t + (s_i \times x_j) + (s_i \times \pi_t) + (x_j \times \pi_t) + \varphi_{ijt},$$

where

- $y_{ijt}$  is the dependent variable (e.g. log wage, unemployment rate) in education category *i*, work-experience category *j*, at time *t*
- *s<sub>i</sub>* is an education dummy
- x<sub>i</sub> is an work experience dummy
- $\hat{\pi_t}$  is a time dummy
- plus many interaction dummies

This is what we want to estimate. For this we need certain tools, inter alia STATA knowledge.

University of Bamberg

# **Data preparation with STATA**

#### The data are derived from micro administrative data (cumbersome)

What is important to know about the data University of Bamberg

- Denmark: IDA register data (social security data)
  - whole universe of the population
- Germany: IEB register data (social security records)
  - 5% sample
- UK: Labour Force Survey data
  - 0,5-1% sample of population
- Differences
  - Country of birth (DK, UK), nationality and past nationality (DE)
  - Education: degrees (DE and DK), years of schooling (UK) due to educational systems
- Many, many details

#### UNREST A OTOO ON OTOO

### Literature reference:

Brücker, Herbert; Hauptmann, Andreas, Jahn, Elke, Upward, Richard (2014), "Migration and imperfect labour markets. Theory and cross-country evidence from Denmark, Germany and the UK", in: *European Economic Review*, Vol. 66, pp. 205-225.

### Variable Definition

- **Year:** 19XX to 20XX
- Education: 3 groups by degree (DE, DK) or years of schooling (UK)
- **Experience:** 4 groups by work experience (0-5, 6-10, 11-20, over 20)
- LHqjt: Number of workers by nationality, education, workexperience and year
- UHqjt: Number of unemployed workers by
- NHqjt: nationality, education and workexperience and year
  NHqjt: Labour force (L+U) by nationality, education, work experience and year
- **Hsumwage:** Wage-sum of native workers (LHt\*wht)
- Fsumwage: Wage-sum of immigrant workers (LFt\*wft)

### How to organize the datafile?

#### Variable

### Definition

- wHqjt:
- wHqt:
- wHt:
- wt

Indices:

- H, F:
- q: • j:
- t:

wage of workers by nationality *H*, education *q*, work experience *j* and year *t* mean wage aggregate by nationality and education and year mean wage aggregate by nationality and year mean wage aggregate by year Same for **L**, **U**, and **N** 

Natives, Immigrants education work experience time (year)

University of Bamberg

# Working with STATA: Introduction into the Basics

### Helpful reading

### **Good STATA textbooks**

- Ulrich Kohler / Frauke Kreuter: Datananalyse mit STATA: allgemeine Konzepte der Datenanalyse und ihre praktische Anwendung, 4<sup>th</sup> Edition. (German)
- Ulrich Kohler and Frauke Kreuter: Data Analysis Using Stata, 2012, 3<sup>rd</sup> Edition. (English)

### STATA Software Package

- 1. Connect to Bamberg University data-net via cable, WLAN or VPN
- 2. Switch to

**\\lizenz01.rz.uni-bamberg.de\Stata\_SoWi** (for Windows)

smb://lizenz01.rz.uni-bamberg.de/Stata\_SoWi (for Mac)

- 3. Insert your username in format uni-Bamberg.de\BA-Kennung
- 4. Use START\_Stata\_SoWi\_Win (\_Mac) button to start Software (doubleclick) Note that this may need several minutes
- 5. Support: <u>softwarebeschaffung.rz@uni-bamberg.de</u>; +49 951 863-1327 (-1333)

#### Note: there are only limited licenses. Close Stata if you don't use it!

### Structure of STATA: Three files

- 1. The **DATA file (.dta)** where you have your data.
  - **DATA BROWSER:** watching your data
  - **DATA EDITOR**: editing your data
- 2. The **DO file (.do)** where you run and save your commands of any session.

Very useful (i) to organize your data set, (ii) to see what you have done in the last session, (iii) to replicate what you have done in last session, (iv) to exchange work with your collaborators.

- You write and run your commands with the DO FILE EDITOR
- 3. The **LOG file (.scmf)** which automatically reports all things which you have done during your session. Is automatically saved after your session. Useful if something goes wrong.

### Getting started

- In principle, you can start your STATA session by (i) loading your data set and (ii) typing your commands in the command window.
- It is however recommended to use the **DO FILE EDITOR** right from the beginning.
- But let's look at the **STATA menus** first.

- For watching your data and changing your data by hand you need the DATA BROWSER and the DATA EDITOR.
- For starting and running your DO files you need the DO FILE EDITOR.
- The other menus are not relevant for the beginning.

### The STATA Menus: The Data Editor/ Browser

### The Grammar of STATA

University of Bamberg

General Structure of STATA commands

### [prefix :] command [varlist] [if] [in] [weight] [, options]

### The Grammar of STATA

University of Bamberg

• We will concentrate on:

### [prefix :] command [varlist] [if] [in] [weight] [, options]

Theory and Politics of European Integration | Dr. Ehsan Vallizadeh | Department of Economics – Integration of European Labor Markets

• What you want to do?

### Examples:

- Run a regression: regress
- Make summary statistics: summarize
- Produce graphs: graph twoway line

Examples:

- r or reg instead of regress
- s or sum instead of summarize
- g instead of graph

University of Bamberg

 varlist is a list of variables, which you have in your dataset

### Examples:

- Foreign wage: wft
- Foreign labor force: Lft
- You can also use list of variables which comprises a number of variables you have defined before (see working with *macros* below).

• The *if* condition constrains what you want to do to a certain condition you have defined.

Example:

• You want to replace a variable with certain values *if* the individuals have higher education:

replace ed3 = 1 if education == 3

### Another example:

 You want to restrict a regression to a subsample, e.g. to foreigners (Nft) only:

reg wqjt mqjt Dqjt Djt Dt if Nft > 0

• **Options** are very often complementing commands, e.g. you can run a regression with fixed effects.

Example:

xtreg wqjt mqjt Dqjt Djt, fe

where fe is the option for fixed effects.

### Grammar of STATA: Types of variables

University of Bamberg

- There are two types of variables (data):
- numerical variables, e.g.: 0, 1, 501, 0.5, -12 etc.
- **string variables**, e.g.: no voc train , male, female etc.
- How to deal with the data types:
- Numerical variables: you can do all mathematical operations,

e.g. var1 + var2, var1/var2, var1\*var2 etc.

- String variables: You have to use quotation marks for identification, e.g.
- var1 = 1 if sex == "female"

# Working with DO FILES: General issues

University of Bamberg

- The standard approach is to start your work with a DO FILE
- Click on the **DO FILE editor button** after starting STATA
- Load an existing **DO FILE** or start a new one
- Save the DO File at the end of your session

### Open your DO FILE editor

University of Bamberg

 After starting STATA click on the DO FILE editor button

### How does a DO FILE look like

University of Bamberg

# DO FILE Menu

University of Bamberg

• Note: STATA stops the DO File execution after the first mistake in your commands. That makes it advisable to proceed step by step.

# Organizing your session: General issues

- The basis for all what you do is your **Do-File** which you open in all sessions first
- Work with a **small data set** and do the generation of all additional variables based on your Do-File in the beginning of each session. Save only the small dataset. That is efficient from the data management side and reduces the risk that you delete/change important variables which you cannot restore. Change somewhere a saved version of your dataset
- Use a **LOG File** that you can see in case of a problem what you have actually done. You seldomly look at it, but you might miss it in an important case
- At the end of session save the Do-file and close Log file
- Close data-file but <u>do not</u> save it: this can destroy your dataset!

# Step 1: Starting your session

- Begin your Do-file with the following useful commands:
   set more off
  - Is not necessary but useful
  - Helps data processing e.g. in long regressions, long statistics

#### capture log close

- closes log file if one is open
- the capture (cap) command is useful since STATA executes this command only if it is need, e.g. if a log file is open

#### log using "path\DE", replace

• Opens a Log-File with the name "DE"

# Step 2: Loading your data

- If you have already a STATA data file:
- The **use** command loads the data
- the "path\data\DE.dta, clear" provides STATA the information on the path where to find the data and the name of the data file (e.g. DE.dta)
- the clear command after the comma clears the memory, which is needed if you have used other data sets before
- Path is the path where STATA can find your data, e.g.
   C:\\Users\...\Documents\STATA\
   Projectseminar\_2018

#### Step 2: Loading your data

File	e Edit Tools View
	🚰 🖶 🗣 🗛 🗠 💌 🖓 💌 🕂 🐨 🕹 🖓 📮

	. use "E:\Seminar_Bamberg\Bamberg\Projektseminar_2018\Data\orig\Germany\data\DE.dta", clear (data citi ed-ex vers08, fulltime workers 92-10)

#### Loading your data from EXCEL

• If you have to import data e.g. from an Excel file, use the command:

#### import excel using path\data\de.xlsx, firstrow

- the **import excel** tells STATA that it has to import a file with a different data format, in this case excel
- using path\data\de.xlsx tells data where to find the data and the file name
- The **option** after the comma **, firstrow** tells STATA that it has to treat the first row of the Excel sheet as the names (labels) of the variables. Otherwise it thinks it are data and you end up in a mess.

# Step 3: Ending your session

- Save your Do-file, e.g.: save uk.do
- Close your Log-file: log close
- Important note: in normal cases don't save your Datafile. If you do this, all changes in your data set are saved and the original data set might be destroyed. You cannot restore the old dataset once it is saved.
- Of course, if you want to save some changes of your dataset, you can save it.

- Your can generate new variables and replace existing ones
- E.g. generate a numerical variable by using the information from a STRING variable
- gen ed = . generates the variable ed with missing values in the first place
- In the next step you can replace the values of this variables by using
- replace ed = 1 if education == "no voc training"
- Which assigns the varianble a value of 1 if the person/group has no vocational training

#### Generating new variables

• Command:

#### replace ed = 1 if education == "no voc training"

- **replace** tells STATA to replace the values of the variable, in this case of the ed variable by 1
- the if option tells STATA under which conditions, note that you have to use double equality sign (==) after the if option
- The "..." in "no vocational training" tells STATA that we have a STRING variable
- Then repeat this until all values of your variable are filled

#### Transform your data by using operators

- Useful operators in STATA:
  - + add
  - subtract
  - \* multiply
  - / divide
  - In transform into natural log
  - exp transform into exponential value

#### **Generate Dummy Variables**

Example:

- Reconsider Borjas (2003) model
- Why dummy variables?
- How to create dummy variables
- Advanced techniques to create dummy variables

$$y_{ijt} = \theta p_{ijt} + s_i + x_j + \pi_t + (s_i \times x_j) + (s_i \times \pi_t) + (x_j \times \pi_t) + \varphi_{ijt},$$

where

- $y_{ijt}$  is the dependent variable (e.g. log wage, unemployment rate)
- s<sub>i</sub> is an education dummy
- x<sub>i</sub> is an education dummy
- pi<sub>i</sub> is a time dummy
- plus many interaction dummies
- Thus, we have to create quite a bunch of dummy variables.
- But, in the first place, what are dummy variables doing?

#### The Role of Dummy Variables

#### How to generate dummy variables?

- Generating DUMMY variables
  - Use the **gen** command, e.g.
    - gen Ded1 = 0
  - This creates a variable consisting only of zeros
  - Then use the **replace** command, e.g.
    - replace Ded1 = 1 if ed == 1
  - This replaces the zeros with 1 if the variables ed1 has a values of 1.

#### Generating Dummy Variables: DO FILE commands

```
***********
***** generate Dummy variables ****************
* education dummies
gen Ded 1 = 0
replace Ded 1 = 1 if ed==1
gen Ded 2 = 0
replace Ded 2 = 1 if ed==2
gen Ded 3 = 0
replace Ded 3 = 1 if ed==3
* experience dummies
gen Dex 1 = 0
replace Dex 1 = 1 if ex==1
gen Dex 2 = 0
replace Dex 2 = 1 if ex==2
gen Dex 3 = 0
replace Dex 3 = 1 if ex==3
gen Dex 4 = 0
replace Dex 4 = 1 if ex==4
* time dummies
gen year 1 = 0
replace year 1 = 1 if year == 1992
gen year 2 = 0
replace year 2 = 1 if year == 1993
```

# Generating Dummy Variables: STATA main window

# **Generating Dummy Variables**

- Another example for generating dummy variables:
  - Use the gen command, e.g.

#### gen Dt1 = 0

- This creates a variable consisting only of zeros
- Then use the **replace** command, e.g.

#### *Dt1* = 1 *if* year == 1991

- This replaces the zeros with 1 if the year variable has a values of 1991
- Note: The STATA syntax requires that you have to use after an if command always a double == for the definition of the value

- Creating series of dummy variables if it is too cumbersome to create them individually, e.g. in case of interaction dummies. Use "forvalues" command
- Syntax:
  - forvalues i = 1/3 {
     forvalues j = 1/4{
     gen D\_ed`i'\*D\_ex`j'
     }
    }
  - i.e. for each value i = 1,2,3 and each value j = 1,2,3,4 you generate an interaction dummy by multiplying the dummy variables for education and experience. Take care of the {}!

#### Theory and Politics of European Integration | Dr. Ehsan Vallizadeh | Department of Economics - Integration of European Labor Markets

Log transformation

- Econometrics is linear, while the real world is non-linear, e.g. concave, convex
- Replacing linear variable into log variable allows estimating non-linear realtionships between two variables
- Transforming variables into log variables
- Syntax:

gen In\_wijt = log(wijt)

 By using again the gen command you can transform the wage variable wijt into the natural logarithm of the wage by applying the **In** operator

Log transformation

Theory and Politics of European Integration | Dr. Ehsan Vallizadeh | Department of Economics – Integration of European Labor Markets

- Econometrics is linear, while the real world is non-linear, •
- e.g. concave, convex Replacing linear variable into log variable allows •
- estimating non-linear relationships between two variables
- Moreover, if the dependent and the independent variable • are transformed into natural logs, we have a nice **interpretation** of the **coefficient**: it is the **elasticity**, i.e. it tells you by how many per cent the dependent variable changes if the independent variable changes by 1 per cent

#### Transforming data

### Organize your data with macros

- It is not convenient if you have to work with too many variables, e.g. 200 dummy variables (that is cumbersome to type some by hand)
- You can define globals, which comprise many variables
- Syntax:
  - glo [name of global [list of variables]
  - glo Di Ded\_1 Ded\_2 D\_ed3
- i.e the global Di consists of the variables Ded\_1 Ded\_2 and Ded\_3
- If you want to use the global later you have to type
  - **\$[globalname]**, i.e. **\$Di**

#### Creating *globals*

***************************************
***** Define globals (short-cuts) for Dummy variables *****
***************************************
glo D i Ded 2 Ded 3
glo D j Dex 2 Dex 3 Dex 4

glo	D_1j	Ded1	ex2	Ded1	ex3	Ded1	_ex4

#### **Descriptive statistics**

- Any econometric analysis requires in the first step that you provide descriptive statistics to the reader. This helps to understand what's going on
- This can be easily done with the sum command sum [variable name(s)]
   sum LHijt LFijt wijt In\_wijt
- The sum command creates a table with the complete descriptive statistics, i.e. observations, mean, standard deviation, minimum, maximum

#### **Descriptive statistics**

- Present your data graphically
- It is usually helpful if you present the main information /variables in your data set graphically
- There are many graphical commands, use the Graphics menu or the respective commands

- The simplest way is to show the development of your variable(s) over time
- Syntax:

#### graph twoway line [variable1] [variable2] if ... graph twoway line wqjt year if ed==1 & ex == 1

 This produces a two-dimensional graph with the wage on the vertical and the year on the horizontal axis for education group 1 and experience group 1

• Graph of mean wage in education 1 and experience 1

!55	
:56	
:57	************************************
!58	********** Graphs ***********
!59	************************************
:60	
:61	
:62	graph twoway line wqjt year if ed==1 & ex ==1
:63	
:64	
:65	graph twoway line mqjt year if ed==1 & ex ==1
:66	
267	

University of Bamberg

#### Example: line graph

#### Graphs with two Y-axes

- Making graphs with two variables on the y axis displayed on two y axes
- Syntax:
  - graph twoway line ([variable1] [variable2]) ([variable 3][variable2], yaxis(2)) if ...
  - graph twoway line (wqjt year) (mqjt year) if ed==1
     & ex == 1
- This produces a two-dimensional graph with the wage and the migration rate on the vertical axes with different scales and the year on the horizontal axis for education group 1 and experience group 1

#### University of Bamberg

- Making graphs with scatter plots which show by point clouds the relationship between two variables
- Syntax:

Scatter plots

- graph twoway scatter [variable1] [variable2] if ...
- graph twoway scatter wqjt mqjt)
   if ed==1 & ex == 1
- This produces a two-dimensional scatter plot with a cloud of points which show for each observation in the sample of education group 1 and experience group 1 the values of the wage and the migration rate

#### Scatter plots with a regression line

- Making graphs with scatter plots which show by point clouds and a simple regression line the correlation (no causality) between two variables
- Syntax:
  - graph twoway scatter [variable1] [variable2] || Ifit [variable1] [variable2] if ...
  - graph twoway scatter wqjt mqjt || Iftit wqjt mqjt if ed==1 & ex == 1
- This produces a two-dimensional scatter plot plus a regression line with a cloud of points which show for each observation in the sample of education group 1 and experience group 1 the correlation between the wage and the migration rate
## Next Meting: June 15

- Begin: 12:00 14:00
- Topic: STATA II Regression Analysis
- All meetings are compulsory.

## THANKS FOR YOUR ATTENTION!
